

PUBLIC HEARING  
STATE OF CALIFORNIA  
DEPARTMENT OF FOOD AND AGRICULTURE  
DAIRY MARKETING BRANCH

DEPARTMENT OF FOOD AND AGRICULTURE  
1220 N STREET  
AUDITORIUM  
SACRAMENTO, CALIFORNIA

FRIDAY, JUNE 2, 2006  
8:05 A.M.

JAMES F. PETERS, CSR, RPR  
CERTIFIED SHORTHAND REPORTER  
LICENSE NUMBER 10063

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

APPEARANCES

HEARING OFFICER

Mr. Michael Krug, Staff Counsel

PANEL MEMBERS

Mr. David Ikari, Chief, Dairy Marketing Branch

Ms. Candace Gates, Research Manager II

Mr. Tom Gossard, Agriculture Economist

Ms. Venetta Reed, Supervising Auditor I

STAFF

Ms. Cheryl Gilbertson, Staff Analyst

ALSO PRESENT

Mr. Richard Cotta, California Dairies

Ms. Sharon Hale, Crystal Cream and Butter Company

Mr. Joe Heffington, California Dairies

Mr. Scott Hofferber, Farmdale Creamery

Mr. David Inman, U.S. Milk

Ms. Tiffany LaMendola, Western United Dairymen

Mr. Michael Marsh, Western United Dairymen

Mr. Albert Nunes

Dr. William Schiek, Dairy Institute

Mr. Mike Shotts, Farmdale Creamery

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

APPEARANCES CONTINUED

ALSO PRESENT

Ms. Patricia Stroup, Hilmar Cheese Company

Mr. Ray Souza

Ms. Sue Taylor, Leprino Foods

Mr. William C. Van Dam, Milk Producers Council

Mr. Geoffrey Vanden Heuvel, Milk Producers Council

Mr. Case Van Steyn

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

1 PROCEEDINGS

2 HEARING OFFICER KRUG: Okay, good morning. The  
3 hearing will now come to order. Let's go on the record.

4 This is Friday, June 2nd. We're continuing the  
5 hearing which commenced yesterday June 1st. It's 8:05 in  
6 the morning. And we will continue with our hearing from  
7 witnesses.

8 MR. VAN DAM: He's not under oath.

9 (Laughter.)

10 HEARING OFFICER KRUG: Okay. It's 8:05 according  
11 to this computer over here.

12 (Laughter.)

13 HEARING OFFICER KRUG: And which will be the  
14 official clock we use.

15 (Laughter.)

16 DR. GRUEBELE: I wouldn't push that any further.

17 (Laughter.)

18 HEARING OFFICER KRUG: Off the record.

19 Back on the record.

20 Okay. The first witness to be called this  
21 morning is Albert Nunes. Is Mr. Nunes here?

22 I'm not seeing him reply. If he arrives later,  
23 he may testify at that time.

24 The next witness in order is Scott --

25 MR. HOFFERBER: Go for it. Hofferber.

1 HEARING OFFICER KRUG: -- Hofferburger and Mike  
2 Shotts.

3 MR. HOFFERBER: Hofferber.

4 HEARING OFFICER KRUG: Hofferber. Well, you can  
5 correct that on the record.

6 As we're preparing here for these witness, I just  
7 wanted to make a note for you all. Yesterday, we did  
8 receive some additional letters into evidence. If anyone  
9 would like to comment on them in their post-hearing  
10 briefs, they will need to make some comments in their oral  
11 testimony through their comments with regard to those  
12 letters. So just keep that in mind.

13 And now we will proceed with the testimony. Will  
14 the witnesses please state their name and spell their last  
15 name for the record.

16 MR. HOFFERBER: I am Scott Hofferber,  
17 H-o-f-f-e-r-b-e-r.

18 MR. SHOTTS: I'm Michael Shotts, S-h-o-t-t-s.

19 HEARING OFFICER KRUG: Mr. Hofferber, do you  
20 swear or affirm to tell the truth?

21 MR. HOFFERBER: I do.

22 HEARING OFFICER KRUG: Mr. Shotts, do you swear  
23 or affirm to tell the truth

24 MR. SHOTTS: I do.

25 HEARING OFFICER KRUG: Are you representing any

1 organization with your testimony?

2 MR. HOFFERBER: We are here on behalf of Farmdale  
3 Creamery, Inc. and their board of directors.

4 HEARING OFFICER KRUG: Could you briefly explain  
5 how your testimony was arrived at?

6 MR. HOFFERBER: Yes. As the controller at  
7 Farmdale, I analyze the petition and the alternative  
8 proposal and gathered other data and drafted testimony  
9 that I presented to my board, revised per their comment  
10 and are here to present it.

11 HEARING OFFICER KRUG: Okay. Can everyone in the  
12 back of the room hear?

13 Yes.

14 HEARING OFFICER KRUG: That's fine. Do you have  
15 any written statements or other things that you would  
16 liken entered in to the record?

17 MR. HOFFERBER: Yes, our statement titled  
18 Farmdale Creamery, Inc. June 1st and 2nd, 2006 is  
19 submitted.

20 HEARING OFFICER KRUG: Okay. That document will  
21 be labeled Exhibit Number 69 and is as admitted into the  
22 record at this time.

23 (Thereupon the above-referenced document was  
24 marked Exhibit 69.)

25 HEARING OFFICER KRUG: You may proceed.

1           MR. HOFFERBER: Good morning, Mr. Hearing Officer  
2 and members of the hearing panel. I am Scott Hofferber  
3 the controller of Farmdale Creamery, Inc. and I am here at  
4 the direction and on the authority of our board of  
5 directors. With me today is Mike Shotts, one of  
6 Farmdale's 2 third-generation family owners and a member  
7 of our board of directors.

8           Farmdale is a small family-owned and operated  
9 dairy processing facility in San Bernardino, near the  
10 diminishing Chino Dairy Preserve. With 72 employees  
11 currently, Farmdale processes around 25 million pounds of  
12 milk and cream per month in to block jack and cheddar  
13 cheeses, sour cream, buttermilk and butter. We are here  
14 today to gratefully take advantage of the opportunity to  
15 provide our perspective.

16           Economic issues. As processor businesses go,  
17 Farmdale is the small family farm of the block cheese  
18 makers. At 100,000 pounds per day in cheese products  
19 produced, we are dwarfed by our competitors in the block  
20 cheese arena who are 15 to 25 times our size. We survive  
21 by a) filling a niche which is benefited by our small  
22 family-owned business culture and b) from one other large  
23 factor an orderly milk market.

24           Like many of the smaller dairy producer families  
25 represented at this hearing, Farmdale relies on the

1 Department and the Secretary to render a reasonable and  
2 orderly milk market environment in which all parties,  
3 large and small, can prosper. Our reliance comes from an  
4 expectation that sound economic principles will prevail  
5 over political and emotional pressures that are brought to  
6 bear on the decision makers.

7           If, on a level regulatory playing field, we find  
8 that we cannot compete just because we are too small, we  
9 understand that the rules of the economics game dictate we  
10 should not continue to play. Similarly, small farmers  
11 face the same fate as Farmdale if their smaller size  
12 prevents them from operating profitably against their  
13 larger-sized peers.

14           Pooling and such regulations, however, exist to  
15 protect smaller farmers within the producer community, but  
16 smaller processors like Farmdale are not afforded the same  
17 protections. Instead, we go head-to-head against larger  
18 competitors, relying on our quickness and flexibility to  
19 take advantage of market opportunities. This has worked  
20 well for us in the past, but as costs of production  
21 continue to climb, our margins get every tighter and as a  
22 commodity cheese maker, we are unable to raise revenues to  
23 offset these costs, relying entirely on the State  
24 regulatory system to provide an adequate make allowance to  
25 maintain the viability of our business.

1           We do not own directly or indirectly an interest  
2 in dairy cows nor are we affiliated by ownership with any  
3 of the co-ops or individual producers. We think this is  
4 an important distinction because we believe that the  
5 co-ops acting as producer handler processors have an  
6 unfair market advantage in finished goods over proprietary  
7 processors, those processors not owned by a co-op.

8           This advantage results from their raw product  
9 procurement not really being an arm's-length transaction,  
10 in essence they're selling raw milk to themselves. The  
11 fact that there is no accountability to the State and thus  
12 the dairy market generally for service charges or premiums  
13 paid on raw milk transfers begs the question as the degree  
14 to which the farmer is actually subsidizing their co-op  
15 owned and thus their own manufacturing plants.

16           We believe, though we do not have access to  
17 supporting hard data, that sales-below-cost and/or  
18 sales-below-regulated-minimum-price provisions are being  
19 violated and go undetected in this protected environment.

20           We, Farmdale, need the Department to uphold the  
21 cost-justified make allowances and the sales-below  
22 provisions if we to be able to compete.

23           Validity of CDFA Cost Data. I went to work in  
24 public accounting in 1982, becoming a Certified Public  
25 Accountant in California in November of 1987, upon

1 completion of the required auditing experience and passing  
2 the 2 and half day exam. While in public accounting my  
3 work included auditing, tax preparation and audit  
4 response, litigation support work, and I talked cost  
5 accounting at a 4-year college for a time. I was hired in  
6 1997 by Farmdale and have recently completed an MBA  
7 program.

8           My first job out of college, lasting 6 years, was  
9 for an engineering company contracted to the Department of  
10 Defense. Nearly all of our contracts were the  
11 cost-plus-fixed-fee variety, and thus we were audited by  
12 defense contract audit agency on a regular basis. Our  
13 costs were audited annually in order to validate our  
14 claimed overhead and other indirect cost rates.  
15 Additionally, each contract was audited as many times as  
16 necessary to validate claims for additional costs, as well  
17 as at the time of application to close out a completed  
18 contract. This personal background the given to support 2  
19 comments.

20           First, as a CPA I understood early that the term  
21 audit applied to all sorts of examinations, surveys,  
22 statistical sampling and other testing procedures all  
23 aimed at gathering competent evidence to support an  
24 opinion or other presentation of information. An audit  
25 that results in I GAAP financial statement is properly

1 conducted in accordance with GAAS, Generally Accepted  
2 Auditing Standards, by accountants certified by the State  
3 as qualified to conduct such an audit and render an  
4 opinion, like CPAs.

5           An audit conducted for another purpose, such as  
6 tax compliance or cost justification, in accordance with  
7 the appropriate guidelines and by qualified or authorized  
8 personnel is certainly an audit. When CDFA staff audit  
9 our cheddar cheese sales -- audited our cheddar cheese  
10 sales, their procedures conformed to my expectations of an  
11 audit, based on my auditing experience, and I certainly  
12 felt audited. The resulting presentation, therefore, has  
13 authority within the conduct it was intended, as far as  
14 Farmdale is concerned.

15           Secondly, CDFA cost survey data are collected for  
16 the purpose of supporting cost justified make allowances.  
17 Some procedures used are auditing techniques, but we know  
18 that the survey process relies on other statistical and  
19 analytical methods as applied to the data, which are used  
20 to achieve the published results. The methods seems  
21 sufficiently comprehensive to us and we call the survey  
22 work an audit for our internal purposes.

23           As such, we prepare the data and our responses as  
24 we would for any auditor. To paraphrase, an audit by any  
25 other name would smell like an audit.

1           The bottom line to this part of our testimony is  
2   that the Department, whose job it is to provide unbiased  
3   administration of dairy marketing laws and regulations,  
4   has spent significant time and energy in developing data  
5   through various audits and surveys for the purposes of  
6   setting cost-justified make allowances and appropriate  
7   minimum prices. The data indicates that the  
8   cost-justified make allowance portions of the minimum  
9   price formulae should be at the level set forth in the  
10  petition of the Dairy Institute of California.

11           Our company's survival as a California-based  
12  organization is dependent on the State adhering to the  
13  cost-justified principle in setting make allowances. We  
14  strongly urge the Secretary to recognize the validity of  
15  those figures, honor the hard work that went into building  
16  them and implement them at the earliest opportunity.

17           A comment made at the hearing workshop to the  
18  effect that the Department might be seen as employing  
19  Enron accounting methods to achieve the results in the  
20  updated cost information is nonsense. The Enron execs are  
21  now convicted of fraud, which means they intended to  
22  manipulate, mislead and misstate the information.  
23  Farmdale sees no such intent in the Department's  
24  procedures and relating disclosures. As stated above,  
25  providing unbiased administration of dairy marketing laws

1 and regulations is what we believe to be the case.

2           We are not at this hearing to reform a process  
3 that has successfully maintained and grown an industry.  
4 Instead, we are here to make the appropriate periodic  
5 adjustments to certain parameters of that proven model,  
6 such that prosperity can continue for all involved,  
7 attrition notwithstanding.

8           Milk Supply. In 2005 we testified to our  
9 understanding that once Monsanto's rBST issues were  
10 resolved, milk supply growth would return to its usual  
11 3-plus percent. We also understood that there was little,  
12 if any, new processing capacity coming on-line to service  
13 such growth. We had said then that quote, "If we  
14 producers and processors together are to continue to move  
15 the milk being produced, we must either a) encourage  
16 processor capacity to grow by offering an economic  
17 environment that presents the possibility of a reasonable  
18 return on investment, or b) see a disorderly reduction in  
19 the milk supply through the failure of farms unable to get  
20 their milk to market for the lack of processing capacity.  
21 Such capacity must be able to compete for sales within and  
22 without California," end quote.

23           Well, we've seen no new cheese plant capacity in  
24 the planning for California and we hear that milk is  
25 finding its way out of state, or worse, being dumped with

1 information yesterday from CDC -- I'm off the testimony  
2 right now, the written. CDC testified yesterday to a  
3 couple of plants and provided some photographs. We can  
4 provide some specific information with respect to the  
5 Hanford project. Having visited that facility myself, a  
6 year ago, I'm aware that they did complete a new whey  
7 plant there and understood that they were going to retool  
8 their cheese side. There's some increase in capacity  
9 anticipated in that. I can't tell you how much, but the  
10 Hanford site, part of their intent is to replace their  
11 existing processing capacity. I imagine the Department  
12 may, by now, have some idea of the extent to the increase  
13 in capacity on the Hanford plant.

14           Back on my written testimony. In fact, companies  
15 with plants in California have planned for or started new  
16 construction outside the state specifically because they  
17 cannot justify the cost benefit of additional investment  
18 here, siting Hilmar and a couple others that have already  
19 been entered into the testimony.

20           Restating from our 2005 testimony, "Setting  
21 minimum milk prices at appropriate minimal levels allows  
22 risk of investment to be appropriately shared between  
23 processors and producers, provides the possibility of a  
24 more attractive ROI or NPV of investment in additional  
25 processing capacity, and frees the market to drive

1 necessary corrections to over/under-supply conditions on  
2 its own, without the need for regulatory intervention on a  
3 frequent basis," end quote.

4           A minimum pricing system in our are opinion  
5 should minimal, so as to allow free-market forces to work  
6 more freely not less freely. Supply and demand 101, if  
7 there is too much milk for consumer demand milk prices  
8 will be low. If prices are too low, either supply will be  
9 cut by attrition of suppliers or processor capacity will  
10 increase as long as adequate cost-benefit margins can be  
11 achieved. Without proper cost-justified make allowances  
12 for processors, no new capacity is coming on-line --  
13 virtually no new capacity is coming on-line, leaving  
14 producer attrition as the proper corrective measure.

15           If there is too little milk for consumer demand,  
16 prices will be high. If prices are high, more supply  
17 might be added, but again without proper cost-justified  
18 make allowances for processors, no new capacity will come  
19 on-line.

20           What we are saying is that if you boil away all  
21 the rhetoric and complexity of the system that has  
22 accumulated over the years and simplify the matter to the  
23 most black and white level, in our view, net producer  
24 prices have only to do with milk production issues and  
25 nothing to do with what it costs us to convert milk into

1 cheese.

2           Dealing With Whey. They are related, but one  
3 doesn't drive the other. Dealing With Whey. We dispose  
4 of our waste whey stream by converting it into a dried  
5 popcorn whey product for animal feed because. Our 2005  
6 average cost per pound to produce is greater than the  
7 Department's current studied whey processing cost figure  
8 of 26.73 cents as based on our internal cost model, and  
9 therefore significantly above the 20 cents currently in  
10 the 4b formula. The shortfall is accounted for in our  
11 regards as an additional cost of making cheese.

12           In the 15 months since we last testified about  
13 our whey processing capabilities, we underwent a formal  
14 cost-benefit modeling exercise to address the viability of  
15 processing whey differently than we do now. We discovered  
16 that economies of scale play a very significant role in  
17 reaching a critical mass of volume necessary to overcome  
18 the baseline fixed cost of such an installation.

19           It takes a certain baseline level of investment  
20 to built a new whey plant infrastructure. From there,  
21 incremental investment can be determined by the projected  
22 size of the whey stream to be processed. The larger the  
23 whey stream, the shorter time required to recapture the  
24 baseline cost of a whey plant.

25           We looked at about 10 different approaches for

1 liquid and powder WPC at various protein concentrations,  
2 liquid and powder permeate and partially processing the  
3 whey stream into a 65 percent liquid to be dried at  
4 another facility. In our looking, we included preliminary  
5 site design and receiving responses from requests for  
6 quotes on the required equipment. One facility offered to  
7 take our potential 65 percent liquid into their WPC-80  
8 plant, but we could not find enough revenue between us to  
9 cover the dual baseline investment and the transportation  
10 costs to transfer the liquid to them.

11           For that project, we attempted to find a reliable  
12 price index to value our 65 percent liquid. One thought  
13 was to tie their WPC-80 sales to the WPC-34 price index  
14 and then relate it to our 65 percent liquid as a direct  
15 percentage or a sales price make allowance scheme. That  
16 negotiation bogged down when we agreed there was not  
17 sufficient correlation between the 2 price curves for the  
18 type margins that we were looking at and that WPC-80 might  
19 not consistently be the end product produced.

20           The best approach we observed of the 10 or so,  
21 assuming our existing cheese-making capacity and assuming  
22 no increases in our milk premiums, resulted in the need to  
23 operate at a 24/7 pace for around 7 years in order to  
24 recover the fixed costs incurred and achieve a reasonable  
25 return on our investment. We have no belief our milk

1 premiums will not rise over that term and could not  
2 therefore commit to an investment that could be as much as  
3 twice the total cost of our existing plant equipment.

4           The 4b Floor. We believe that in all fairness  
5 floor prices should remain out of the 4b formula. We must  
6 maintain an environment of shared risk between producers  
7 and processors. It is not in the best interests of  
8 current and future cheese processing in California to have  
9 the processors indemnify the producers in low markets  
10 through the use of a floor. This is especially true when  
11 the processor doesn't materially participate in the  
12 benefits of higher cheese prices when those markets occur.

13           The Petition and Selected Alternative Proposals.

14           We support the Dairy Institute of California  
15 proposal as outlined in their petition because we believe  
16 they fairly reflect proper economics necessary to maintain  
17 a successful working relationship between the producers  
18 and the processors.

19           Without an expectation for a reasonable return on  
20 investment, new processing capacity will not come to  
21 California as we have seen over the last 6 years.  
22 Specifically, Farmdale cannot consider investing the  
23 capital necessary to upgrade our whey plant and with  
24 increasing regulatory controls and pressures within the  
25 dairy industry and in the general business environment in

1 California, we are now looking outside the state for an  
2 opportunity to expand or relocate.

3           The Western United Dairymen proposal states  
4 quote, "This proposal would reinstate the floors that were  
5 eliminated as a result of the February 2005 hearing.", end  
6 quote. What is lost in this statement is that those same  
7 floors were only put into effect in 2003 in a politically  
8 charged hearing environment. The 2005 removal was a  
9 proper correction of a prior improper decision, a mistake  
10 that need not be repeated.

11           As to quote, "...the timing could not be worse  
12 for the call of a hearing that seeks to lower producer  
13 prices", we reiterate our assertion that net producer  
14 prices have nothing to do with what it costs us to convert  
15 milk into cheese.

16           The Alliance of Western Milk Producers' proposal  
17 advocates indexing energy costs. This seemed an  
18 interesting idea to us from the standpoint of keeping  
19 things as current as possible. On further reflection  
20 however, indexing an electricity component will open a  
21 door to indexing more components and make an already  
22 complicated process more complicated. And we question  
23 just how the mechanics of such an index would work.

24           Considering the variety of electricity producers  
25 and the procurement contracts employed around the

1 industry, we think that the current annual survey is an  
2 adequate methodology for our purposes. As to the cost of  
3 whey production, our own whey processing cost data above  
4 stands in stark contrast to Dr. Ling's assertion of .1141  
5 cents per pound. As to dry whey make allowance snubbing,  
6 we apply our same argument against flooring, let the  
7 markets work.

8           The California Dairy Campaign proposes a very low  
9 make allowance. Again diversity in practices and costs  
10 around the state may make such a system too complicated,  
11 so we favor the status quo. We would be happy to  
12 participate in an investigation in to discussions  
13 surrounding or a model-building exercise to assess the  
14 viability of indexing the make allowance or its  
15 components, but to change to such a system at this time  
16 without adequate planning would be highly disturbing to  
17 our operations.

18           Having said all that, the CDC also proposes  
19 flooring prices and snubbing the whey make allowance,  
20 which seems to contradict the sharing intent of their  
21 variable make allowance idea, share and share alike, both  
22 risk and reward.

23           HEARING OFFICER KRUG: You have about 2 and half  
24 minutes left.

25           MR. HOFFERBER: Thank you.

1           The Milk Producers Council proposal expresses  
2 grave concern about Dairy Institute's increasingly  
3 aggressive approach. This comment, is an our view,  
4 testimony to the validity of the Institution's petition.  
5 It is time for the cost-justified make allowances to be  
6 based upon the unbiased data collected and not based upon  
7 water-down, ignored or protectionism-filtered assertions  
8 as to what the data should be. Again, flooring, snubbing,  
9 indexing, tweaking, kicking and screaming all add  
10 complexity to the process and reduce market efficiencies.

11           As to Package B and the comment quote, "That  
12 modern cheese plants seldom, if ever, make whey cream  
13 butter Grade B..." end quote, we must assert for the  
14 record that the "if ever" portion can be stricken as we do  
15 convert our whey cream into Grade B butter. Oh, and we  
16 think we are a modern plant having completely retool our  
17 cheese line over the last 6 years.

18           In summary, we continue to believe that a whey  
19 factor should not be included in the pricing formula as a  
20 way to increase overall producer prices. The concern  
21 voiced in '03 and '05 was that having such a factor in the  
22 formula would mostly serve to complicate matters already  
23 too complicated and that has certainly come to pass. See  
24 how different ideas we are contemplating at this hearing.  
25 The benefit to producer revenues surely has not been what

1 was hoped for. If it has had the desired effect, why did  
2 the producer-driven proposals seek to change the whey  
3 factor construct in the formula.

4 Lastly, I recently ran across this piece in my  
5 E-mails one fine day when the California anti-business  
6 gremlins had gotten the best of us:

7 Get fined for reporting an accident in 8 and a  
8 half, instead of 8 hours, W dollars;

9 Develop and implement a high pile storage plant  
10 for a city fire department that does nothing to enhance  
11 their ability to respond to a fire, X dollars;

12 Modifications to the sewer discharge system that  
13 have no benefit to the city sewer plant, Y dollars;

14 Develop and implement a risk-management plan for  
15 a county fire department in a 50-year safe ammonia  
16 operation, Z dollars;

17 Getting my business the hell out of California,  
18 priceless.

19 (Laughter.)

20 MR. HOFFERBER: By the way, the total of W, X, Y  
21 and Z was \$395,000.

22 With out request for the ability to submit a  
23 post-hearing brief, this testimony is respectfully  
24 submitted.

25 HEARING OFFICER KRUG: Your request to submit a

1 post-hearing brief is granted. Before we start with the  
2 panel questions, I'd just like to reiterate, during your  
3 testimony you made reference to other documents you might  
4 have or documents or information you think the Department  
5 has or should have in consideration of this. Keep in mind  
6 our record of this is a public document, but we only can  
7 consider what is presented to us. If you have anything in  
8 addition, please provide it.

9 MR. HOFFERBER: So when we're quoting our prior  
10 testimony, we should then attach that prior testimony to  
11 the post-hearing brief?

12 HEARING OFFICER KRUG: No, that's not necessary.  
13 You were making reference to some other cheese plants and  
14 their progress, what's occurring with them, that's what  
15 caught my attention.

16 MR. HOFFERBER: Are you talking about my comments  
17 regarding the Hanford situation?

18 HEARING OFFICER KRUG: Yes. If you have some  
19 additional information you think we should consider, you  
20 need to present that to us.

21 MR. HOFFERBER: Sure.

22 HEARING OFFICER KRUG: Okay, thank you.

23 Does the panel have any questions for these  
24 witnesses?

25 Mr. Gossard?

1           MR. HOFFERBER:  It's a new day, Tom.

2           AGRICULTURE ECONOMIST GOSSARD:  In your testimony  
3 you mentioned the diminishing Chino milk supply.  You also  
4 said that you had been given consideration to relocating  
5 out of state.  Two things, has the milk supply in southern  
6 California become a problem for you -- the diminishing  
7 supply, I'm sorry?

8           MR. HOFFERBER:  Because of -- there was some  
9 discussion earlier here about that being about balancing  
10 plants and balancing capacity.  And a little plant our  
11 size often has played that role in the past.  When  
12 supplies got heavy, we would be approached by our  
13 suppliers to take additional milk.  We are not getting  
14 that call at this point.  We think, though, what we would  
15 have been getting called to do is being absorbed at this  
16 point by DFA's plant in Corona, through the arrangement  
17 they've got going with CDI in that thing.

18           There's a whole broad discussion about the impact  
19 of the Corona plant on our outlook and our future.  If you  
20 take the Corona plant out, the argument for the milk  
21 supply might change.  But every time we think that might  
22 actually happen, something else changes in their business  
23 model that keeps them in place, which continues to keep  
24 pressure on us, keeping us away from making a long-term  
25 decision to stay put.  That's the crux of the problem

1 there. They're so big that if they were to go away, there  
2 would be a flush, again for a time, for a plant relative  
3 to our size, assuming no new capacity comes on line in the  
4 southern area.

5 AGRICULTURE ECONOMIST GOSSARD: On page 2 of your  
6 testimony you mentioned your concerns about sales below  
7 cost. Have you formally brought your concerns to the  
8 Dairy Marketing Branch, particularly the Enforcement Unit?

9 MR. HOFFERBER: No, not formally.

10 AGRICULTURE ECONOMIST GOSSARD: Wouldn't that be  
11 appropriate, if you have these concerns?

12 MR. HOFFERBER: Yes, it would.

13 AGRICULTURE ECONOMIST GOSSARD: You spent some  
14 time discussing what is and is not an audit. When you  
15 talked about the GAAP financial statement, that would be a  
16 general financial audit, which has a certain specific  
17 meaning, it's one type of audit?

18 MR. HOFFERBER: Sure a GAAP audit is what you see  
19 presented for concerned business, where an opinion has  
20 been rendered on whether those financial statements fairly  
21 present the position of the company. It's a traditional  
22 company financial statement, and the audit thereon  
23 examines that through auditing procedures and tests and  
24 whatnot so that the auditor can render an opinion as to  
25 whether they think that financial statement fairly

1 presents the condition of the company.

2 That is the capital audit. But there's all kinds  
3 of other small "a" audits, which is the point of what I'm  
4 talking about.

5 AGRICULTURE ECONOMIST GOSSARD: Finally, you were  
6 address the Alliance of Western Milk Producers' proposal  
7 for indexing and you mentioned electricity. Their index  
8 actually uses natural gas.

9 MR. HOFFERBER: Okay.

10 AGRICULTURE ECONOMIST GOSSARD: Would the same  
11 statement apply if you substitute natural gas?

12 MR. HOFFERBER: Sure.

13 AGRICULTURE ECONOMIST GOSSARD: The variety of  
14 natural gas providers --

15 MR. HOFFERBER: Sure. Oh, absolutely. In fact,  
16 we're probably more aware personally -- as a company more  
17 aware of different ways of going about procuring natural  
18 gas, you know, for pricing and whatnot sort of agreements.  
19 Everybody is going to be in way different places depending  
20 on their particular risk tolerances as to what they're  
21 actually paying.

22 AGRICULTURE ECONOMIST GOSSARD: Thank you very  
23 much.

24 MR. HOFFERBER: Yes.

25 AGRICULTURE ECONOMIST GOSSARD: No further

1 questions.

2 HEARING OFFICER KRUG: Ms. Reed, do you have any  
3 questions for the witnesses?

4 SUPERVISING AUDITOR REED: No, I don't.

5 HEARING OFFICER KRUG: Ms. Gates?

6 RESEARCH MANAGER II GATES: No.

7 HEARING OFFICER KRUG: Mr. Ikari.

8 DAIRY MARKETING BRANCH CHIEF IKARI: No, I don't.

9 HEARING OFFICER KRUG: Thank you very much.

10 You're excused.

11 Our next witness is Patricia Stroup.

12 Is the witness ready?

13 MS. STROUP: Yes.

14 HEARING OFFICER KRUG: Okay. Thank you, Ms.

15 Stroup. Will you please state your full name and spell  
16 your last name for the record.

17 MS. STROUP: Patricia Stroup, S-t-r-o-u-p.

18 HEARING OFFICER KRUG: Ms. Stroup, do you swear  
19 or affirm to tell the truth?

20 MS. STROUP: I do.

21 HEARING OFFICER KRUG: Are you representing any  
22 organization today?

23 MS. STROUP: Yes. I am representing Hilmar  
24 Cheese Company, and I developed this testimony in  
25 cooperation with the staff there and it's approved by the

1 chief executive officer and the board of directors.

2 HEARING OFFICER KRUG: So is this testimony --  
3 this is Hilmar Cheese's testimony?

4 MS. STROUP: Correct.

5 HEARING OFFICER KRUG: Thank you very much. Do  
6 you have any written statements or other things you would  
7 like entered into the record at this time?

8 MS. STROUP: Yes, a statement titled Statement of  
9 Patricia D Stroup on behalf of Hilmar Cheese Company  
10 Incorporated.

11 HEARING OFFICER KRUG: Okay. I have a document  
12 here you previously provided to the panel. It will be  
13 marked exhibit 70, 7-0, and it's now admitted into the  
14 record.

15 (Thereupon the above-referenced document was  
16 marked Exhibit 70.)

17 HEARING OFFICER KRUG: You may proceed.

18 MS. STROUP: Thank you.

19 I am the Director of Dairy Policy and Producer  
20 Services at Hilmar Cheese Company Incorporated, which I  
21 represent today at this hearing. Hilmar Cheese Company  
22 operates a cheese and whey products facility in Hilmar,  
23 California.

24 This plant currently processes approximately 12  
25 million pounds of milk per day into American-style cheeses

1 such as cheddar and Monterey jack. In addition to our  
2 California facility, Hilmar Cheese Company is building  
3 another American-style cheese plant in Dalhart, Texas,  
4 with plans to begin operations in the fall of 2007. We  
5 plan for the Texas plant to eventually process at least 9  
6 and a half million pounds of milk per day.

7           My qualifications for presenting this testimony  
8 are attached as Appendix A. Hilmar Cheese Company  
9 currently procures milk from about 275 direct-ship  
10 California dairy farms, as well as from several California  
11 cooperatives and other proprietary handlers.

12           My testimony today is in support of the  
13 petitioner's request for changes to the Class 4b formula.  
14 My time will focus on a few of the specific details of the  
15 formula and explained from our perspective why there must  
16 be changes.

17           Hilmar Cheese Company's support of changes is  
18 based on 2 primary factors. First, the minimum regulated  
19 price dictated by the Class 4b price is too high. Second,  
20 the regulated pricing system in California suppresses  
21 product innovation and handicaps our state's industry  
22 because of its lack of flexibility. When compared to  
23 other regions of the United States and particularly to  
24 other areas of the globe, California's system is  
25 restrictive and stringent. I understand that this pricing

1 system is designed to protect and enhance dairymen income.  
2 And I also realize that current dairy commodity prices  
3 make now, in the eyes of dairymen, an unfortunate time to  
4 change that system. However, we are at a cross-roads in  
5 the state where the short-term producer returns are  
6 battling against the long run success of this entire  
7 industry. Currently, the short-term is winning and it  
8 does not bode well for the future of our industry.

9           We at Hilmar Cheese Company are for high producer  
10 prices, that is why we were founded, to return more money  
11 to dairymen, but high regulated prices are not the answer.  
12 I understand the motivation behind pooling, but pushing  
13 minimum class prices up so that there is more money from  
14 certain products to redistribute is not a long-term  
15 solution to improving producer income. We want an  
16 industry that is innovative and brings in more dollars to  
17 producers because of increases in demand due to innovative  
18 and popular dairy products, not an industry that simply  
19 redistributes dollars we already have, and in the case of  
20 Class 4b right now, dollars we really don't have.

21           High regulated prices that incorporate proceeds  
22 from all dairy products even byproducts like whey, do  
23 nothing to encourage innovation. In fact, at this  
24 extreme, pooling only takes money from those producers who  
25 have invested in innovation and consumer demand and gives

1 it to those who haven't.

2 Did any of us go out last year and purchase a  
3 computer manufactured in 1991? I would venture that none  
4 of us did. Why not? Because there are newer and better  
5 models. There are computers now that meet our needs  
6 better than those manufactured 15 years ago. The State's  
7 behavior in not allowing manufacturers the margins  
8 necessary to invest in research and development, and more  
9 importantly trying to incorporate every one of the new  
10 products into a regulated price gives manufacturers little  
11 incentive to innovate.

12 So what happens? We end up with an industry with  
13 shrinking Class 1 utilization because consumers turn to  
14 other, more innovative and interesting beverages. We end  
15 up with a shrinking Class 4b utilization, because protein  
16 consumers turn elsewhere, like to soy, and cheese makers  
17 can't afford to do business here, and we end up with a  
18 growing Class 4a utilization because we have a federal  
19 support program, not real customers that will buy the  
20 product. We are still pursuing dairy policies and a  
21 regulated pricing mind-set crafted many decades ago. That  
22 hard drive is crashing. So, in the dairy industry,  
23 consumers are left buying 15-year old computers. And you  
24 know what? They're not interested. Is that the future we  
25 want for the industry of this state.

1           A minimum regulated price should be just that, a  
2 minimum. Unless the regulated price level for milk is  
3 decreased, dairy companies will not build facilities in  
4 this state, dairy companies will not try to make  
5 innovative products in this state, and dairy companies  
6 will choose to expand facilities outside of this state.

7           This hearing distills down to basically one  
8 thing, regulated price level. The regulated price level  
9 is too high. I will go in to the details of what is  
10 driving that later, but the result is that it is pushing  
11 dairy processing facilities out of California and it is  
12 scaring away potential investors. Sure, there are other  
13 reasons that businesses are anti-California. But you add  
14 an inflexible regulated price of milk to that, and you  
15 erase any glimmer of opportunity that processors might see  
16 here.

17           So, if processors choose not to put in  
18 manufacturing capacity in California, what happens? Will  
19 growth in milk production in California stop? Contrary to  
20 economic logic and the opinions of some producer leaders,  
21 it's apparent that milk production will continue to grow.  
22 If proprietary processors choose not to grow capacity in  
23 the state, producers themselves will need to build plants  
24 to accommodate the excess milk production.

25           What will they build? The margins for cheese

1 plants, as you've heard already many times yesterday and  
2 today, are not high enough to justify building cheese  
3 facilities, and the demand for Class 1, 2 and 3 is not  
4 increasing fast enough to stimulate -- or at all to  
5 stimulate processing growth in those sectors.

6 That leaves Class 4a. Sure enough according to  
7 news releases the next major dairy plant to come on-line  
8 in California is a Class 4a plant owned by producers and  
9 is slated for 2007.

10 Given historical growth in milk production in  
11 California, we can expect a conservative average increase  
12 in milk production of about 3 to 4 percent. That's enough  
13 new daily milk production to fill a new plant every single  
14 year. With the current structure of the regulated pricing  
15 formulas, we must assume that all new production will go  
16 into class 4a products, not even considering the likely  
17 drop in butter prices because of increased production and  
18 only using historic commodity prices, increases in Class  
19 4a utilization means decreases in producer pay prices, so  
20 the long-term loses.

21 Hilmar Cheese Company supports the elimination of  
22 the whey factor. There are several mechanisms that are  
23 driving the high regulated price in California. First,  
24 the inclusion of the whey factor in the Class 4b price  
25 without an accurate make allowance has driven up the

1 regulated price. What CDFA estimated using historical  
2 markets as a .19 cent increase in Class 4b price, when the  
3 whey factor was implemented has turned into a .37 cent  
4 increase and more recently a .66 cent increase. Because  
5 of this, cheese maker margins have been driven down to  
6 critical levels.

7 I've attached an illustration of the cheese milk  
8 spread as Appendix B. If you look at that graph, what I  
9 have is the CME price times 10, minus the Class 4b price.  
10 Cheese makers don't get the CME price, because cheese is  
11 usually sold in discounts to the CME, but you can use this  
12 as an index. We also probably pay more than the Class 4b  
13 price because of premiums.

14 But if you just look at this little index, you  
15 can see that simple cheese margins were relatively  
16 consistent until the implementation of the whey factor.

17 While the absolute milk costs are not as simple  
18 as Class 4b because of premiums, it is safe to say that  
19 what used to be a fairly consistent spread between cheese  
20 prices and milk costs has turned into a rollercoaster  
21 headed downhill. Whey proceeds have not increased to make  
22 up the difference. One of my employees summarized this  
23 graph aptly. He said, "It looks like we built an industry  
24 in this state and now we are trying to kill it."

25 It is no secret that Hilmar Cheese Company

1 eliminated its minimum premium payments this year.  
2 Frankly, we did this because we could not afford them.  
3 Only 22 percent of our producers now receive premiums. So  
4 much of our revenues are going into the Class 4b price  
5 that we have little left for premiums. The biggest danger  
6 in incorrectly setting a minimum price is if that price is  
7 set too high. If it is too low, the marketplace will step  
8 in and competition will increase premiums to producers,  
9 but the minimum is too high, there is no remedy. The  
10 inability to pay premiums essentially means that only  
11 ranch to plant transportation cost differences will move  
12 milk.

13           This strategy assumes that all milk is the same.  
14 We would argue that it is not. Milk has a highly complex  
15 chemical makeup and can differ greatly. Premiums should  
16 be available to attract different milks to different  
17 markets, to move each milk to its highest and best use.

18           The excessive regulated price is not a problem  
19 unique to California. Cheese plants in federal orders  
20 have addressed part of this problem at an emergency  
21 federal hearing earlier this year. Other issues related  
22 to the federal order pricing and its whey factor will be  
23 addressed in the future. In the meantime, when whey  
24 prices become untenable plants in federal orders were able  
25 to depool and pay below the Class III price. I've

1 attached Appendix C as a discussion of why Class III and  
2 Class 4b are not valid price comparisons.

3 Those plants in situations outside of regulated  
4 pricing systems have not faced the same challenges with  
5 whey pricing. Instead, they have been able to channel  
6 profits in to competitive cheese pricing, expansions and  
7 upgrades and attracting high solids milk to their plants.

8 I appreciate the challenges the Department faces  
9 in valuing the whey stream. So many diverse whey products  
10 are produced in California that it is difficult to choose  
11 a standard product and then to value manufacturing costs  
12 of that product. For that reason alone, the whey factor  
13 should be removed from the regulated price formula. I  
14 appreciate that hearing panel has agreed with this  
15 position in the past and the foundations for this stance  
16 still hold true.

17 Arguments could be made that diverse cheese  
18 products are made within the State and we manage to be  
19 able to use cheddar cheese as a base line for pricing milk  
20 going into all types of cheese. However, while cheeses  
21 are marketed into similar markets and generally priced off  
22 of the CME market, whey products have completely different  
23 end uses, and at some levels are not priced off of any  
24 published market at all. It may seem that an easy  
25 solution would be for all of us to price our whey products

1 at some premium to a standard market.

2           However, this is not likely for 2 very important  
3 reasons. First, more than a third of whey protein  
4 concentrate is exported and faces international  
5 competition not reliant on U.S. published prices.  
6 Secondly, and extremely important for the long-term  
7 viability of the category, whey products' biggest  
8 competition is not from other dairy products, but from soy  
9 proteins. Soy is not subject to regulated prices and is  
10 not correlated to dairy prices, even dairy competition for  
11 whey proteins, usually skim milk powder is not included in  
12 California's regulated price. So we end up with a whey  
13 market place included in the milk price that may or may  
14 not be related to the markets that our whey products  
15 actually face.

16           In the case of a whey factor, it is very much a  
17 case of be careful what you ask for. The use of a whey  
18 factor encourages cheese plants to produce a certain type  
19 a whey product and risks oversupplying that market and  
20 causing extreme price depression. Because whey operations  
21 by nature are not flexible enough to switch drastically  
22 between products and because they are so capital  
23 intensive, investments in one form of whey can end up  
24 being a liability.

25           For example, since 1991 Hilmar Cheese Company

1 invested \$98 million into a whey protein concentrate  
2 facility and companion lactose facility. But the rules of  
3 the game have changed. Since the 2003 addition of the  
4 whey factor, we have paid for milk based on, among other  
5 things, the dry whey market. We do not make or sell dry  
6 whey, but do make whey protein concentrate and lactose.  
7 Per pound of protein, this meant buying whey proteins  
8 based on a market that has on average since 2003 been 15  
9 cents per pound greater than what we sell our products  
10 for.

11 In 2005 and 2006 to date, the negative spread has  
12 increased to 39 cents per pound of protein. Because  
13 lactose is produced as co-product to WPC and the lactose  
14 cost of production is higher on average than its selling  
15 price, the difference between cost and revenue for whey  
16 solids is actually even higher for us. This is all  
17 exacerbated by an unrealistically low make allowance on  
18 dry whey.

19 I, by the way, am not a CPA, one of the few  
20 testifying who is not, but it does not take an accountant  
21 to figure out that this is a losing proposition. And if I  
22 were not able to figure this out for myself, the people  
23 who are CPAs at my company are in my office constantly  
24 reminding me of this fact. They point out to me that I  
25 cannot spend this much money for whey solids and still

1 have a viable business. And my only answer to them is  
2 that I don't have a choice.

3           It is actually in the best interests of milk  
4 producers to have multiple forms of whey manufactured in  
5 California, because it results in a stronger manufacturing  
6 industry and more competition for milk. A whey factor  
7 gives cheese plants little incentive to produce diverse  
8 whey products. So a simply solution to the current  
9 pricing problem would be for all plants to simply dry  
10 whole whey as a disposal method.

11           Imagine the price decrease in the whey market if  
12 the majority of the whey stream went into a single  
13 product. Our engineers estimate that adding a whey  
14 processing facility to enable us to switch between whey  
15 and WPC facilities would mean an additional capital  
16 investment of at least \$45 million, and would result in  
17 idle capacity in one of those plants all the time. Worse  
18 yet, it would mean trying to turn customers off and on to  
19 each of these products, which are generally not  
20 substitutable.

21           Removing the whey factor from the Class 4b  
22 pricing formula could bring the regulated minimum price  
23 back just to that, a minimum. Does that mean that whey  
24 proceeds will not be distributed to dairymen? Absolutely  
25 not. It just means that those proceeds will not be part

1 of a regulated and pooled price, much as the proceeds from  
2 skim milk powder or buttermilk powder are not incorporated  
3 into the regulated price.

4           It has been suggested in an alternative proposal  
5 to construct the whey factor so that it incorporates more  
6 than one whey product. And perhaps that sounds like a  
7 good idea. However, there are several problems with this  
8 approach.

9           First, most of the testimony at both this hearing  
10 and at the 2006 federal order hearing revolves around the  
11 difficulty in determining a fair and accurate manufacturing  
12 allowance. As it is, we only have 3 straight whey plants  
13 in California that we can use for a cost study. The  
14 numbers of each variety of WPC and WPI would be equally  
15 small. The WPC manufacturing allowance suggested by  
16 alternative proposals is at best capricious. As we have  
17 been analyzing the whey industry to decide how to cope, we  
18 did extensive analysis on the cost of production of  
19 various whey products.

20           As some in the industry like to quip, one thing  
21 we know for sure is that dry whey processing costs  
22 somewhere between 12 and 30 cents. Given that the CDFA  
23 cost studies are held up as a model for the industry, they  
24 are quoted at federal order hearings, have been used as a  
25 model for federal cost surveys, and are used extensively

1 in other parts of the California milk pricing formulas,  
2 and given that the whey studies with significantly lower  
3 costs have been discredited extensively at this year's  
4 federal order hearing, the best that we can do to  
5 approximate the appropriate manufacturing costs for dry  
6 whey in California until it is removed from the formula is  
7 to use the CDFA numbers. That is what we do for cheese.  
8 That is what we do for butter. And, that is what we do  
9 for nonfat dry milk. It should be consistent for whey.

10           Additionally, while the alternative proposal  
11 calls for inclusion of WPC-34, this does not solve the  
12 problem of those manufacturing WPC-80 or WPI. And even  
13 including 34 would then mean that not even the makers of  
14 dry whey would have an input highly correlated to their  
15 markets. We constantly analyze the relationships between  
16 dry whey WPC-34 and WPC-80. Those relationships, as  
17 measure by R-squared values or correlations are not within  
18 any significant confidence level. Over certain time  
19 periods correlations are even negative, meaning the price  
20 of one product is going up while the price of another is  
21 going down. I have attached a graph as Appendix D that  
22 illustrates these unpredictable relationships.

23           You'll note that I have not listed, because of  
24 proprietary pricing reasons, I do not have cost per pound  
25 listed. However, the scale on the graph is accurate.

1           As a side note, an alternative proposal  
2 recommends pricing whey cream at the CME butter price. In  
3 our case, we do not reincorporate any whey cream into our  
4 cheese because the practice is known to cause quality and  
5 yield issues. I would not consider reincorporation of  
6 whey cream into cheddar cheese to be an industry standard.  
7 The CME butter price would greatly overvalue the fat in  
8 whey cream.

9           Hilmar Cheese Company opposes any form of a  
10 snubber including commodity price floors in the regulated  
11 pricing formula. From an economics standpoint a snubber  
12 introduces an artificial impact in to the pricing formula.  
13 The regulated price recognizes values for various  
14 commodities. When those commodity prices are lower than  
15 the cost of conversion, those commodities are a liability  
16 and should be reflected as such in the regulated price. A  
17 snubber shifts value back and forth between products in a  
18 random manner.

19           For example, a snubber in a whey make allowance  
20 overvalues the whey proteins in milk and necessitates that  
21 the revenues in cheese operations make up the difference.  
22 The components going into cheese are already accounted for  
23 in the formula and carry their own costs.

24           A commodity floor does the same thing. It puts  
25 an artificial value on one or more components in the

1 regulated price. A floor in commodities in regulated  
2 California prices puts the entire burden of supporting  
3 milk prices above the federal order support level on  
4 California processors.

5           Finally, and most importantly, one of the  
6 purposes of a regulated price is to clear the market.  
7 When prices are at their most depressed, economics would  
8 indicate that the low prices are the result, at least in  
9 part, of high production. I don't think there's any doubt  
10 by economists that the low milk prices we are seeing now,  
11 are the result of huge increases in milk production. Why,  
12 at a time when milk production is too high, would we pay  
13 an artificially high price? For this reason, I also  
14 oppose any form of a variable manufacturing allowance that  
15 mutes supply and demand signals between the marketplace  
16 and producers.

17           Manufacturing allowances that share the gain and  
18 that share the pain may be politically attractive and make  
19 us all feel good, but from an economic point of view, they  
20 will actually exacerbate swings in milk production by  
21 distributing too much money to producers when milk  
22 production is high and not enough to producers when milk  
23 production is low.

24           We support an overall reduction in the overall  
25 regulated price. Last year in testimony I predicted that

1 we would run out of processing capacity in the state by  
2 the end of 2006. Apparently, that has already happened.  
3 We feel that cheese plants will be shutting down in  
4 California within the next 24 months. That will take even  
5 more processing capacity out of the market.

6           As Director or Procurement at Hilmar Cheese, my  
7 staff and I have taken countless distress calls from  
8 co-ops and other handlers in California this year looking  
9 for a home for milk, and I quote, "at any price." This  
10 milk was and is clearly distressed. Dispatchers have told  
11 me that they are having to dump milk, that they were  
12 shipping as much as they could out of state, and the  
13 receiving stations at California plants had waiting times  
14 upwards of 10 hours in some cases. Hauling companies have  
15 complained to me that their milk trucks are being used as  
16 portable milk silos at other plants because those plants  
17 were out of room. Dispatchers have shared that they would  
18 send more milk out of state, but that so many trucks were  
19 tied up trying to get into plants within the State, that  
20 there were not enough trucks available to send milk out of  
21 state.

22           And, yet, if I wanted to buy that milk, I would  
23 have to pay the state-regulated price for it and not a  
24 penny less. Why? Why would I want to buy it when I know  
25 that I would not be able to recoup the cost of that milk

1 in my final products because of the disconnect between the  
2 whey factor and revenues from our actual whey products?  
3 The minimum regulated price must come down.

4 Last year I reported to this panel that we were  
5 in the midst of a very difficult and consuming strategic  
6 decision. We knew we needed to expand our business by  
7 building a new plant. I pointed out some of the  
8 challenges that we see with doing business in California  
9 including transporting our product to market and the level  
10 of uncertainty of regulation in both milk pricing and  
11 business issues. I applaud this panel for making the  
12 right recommendation to the Secretary last year, when it  
13 suggested removing the whey factor and commodity floors  
14 from the Class 4b price. I'm extremely disappointed that  
15 the Secretary did not heed that complete recommendation.

16 In this case it lost the state of California a  
17 \$190 million long-term plan investment, more than 1,800  
18 dairy industry jobs and a home and viable market for up to  
19 9 and a half million pounds of milk per day. The Perryman  
20 Group in Waco, Texas estimated in a report to the state of  
21 Texas that the total economic impact of our cheese  
22 facility to the region at maturity will be \$2.3 billion  
23 and 11,000 total industry and support jobs. Processors  
24 will continue to make the conclusion that we did to avoid  
25 California if this state cannot make the decisions that

1 are write for this industry as a whole rather than what is  
2 emotionally popular at the time.

3 I recognize that when dairy product prices are  
4 low, causing low milk prices, it is difficult to make  
5 formula changes. But there is no more capacity to process  
6 milk in this state and that problem will only get worse.  
7 The long term is at stake.

8 A couple of notes on prior testimony yesterday  
9 and today just as clarifications. I do note in the MPC  
10 written testimony that there is a table on yields that  
11 lists 3.7, 3.1 milk is producing 10.2. I just want to  
12 point out to the panel that that is true protein and not  
13 total protein in California. We use total protein, so if  
14 you had a 2.9 percent total protein, and 3.7 fat, that  
15 would be a 9.91 yield.

16 Also, as a note, on the federal order hearing, in  
17 questions of why we have not addressed the existence of a  
18 whey factor in the federal order hearing. The call of the  
19 federal order hearing in January was specifically limited  
20 to changes in the make allowances and we were not even  
21 permitted to discuss the possibility of removing the whey  
22 factor from the formula. That will be something that we  
23 address in the future.

24 Thank you for allowing me to express the views of  
25 Hilmar Cheese Company. I'd be happy to answer any

1 questions you may have and be respectfully request the  
2 opportunity to submit a post-hearing brief.

3 HEARING OFFICER KRUG: Thank you very much. Your  
4 request to submit a post-hearing brief is granted.

5 Do we have any questions for this witness?

6 Mr. Gossard.

7 AGRICULTURE ECONOMIST GOSSARD: On page 7 of your  
8 testimony you state, "The WPC make allowance suggested by  
9 alternate proposal..." -- from Milk Producers Council --  
10 "...is not even close to the projected cost of processing  
11 WPC-34."

12 What were those projected costs?

13 MS. STROUP: That we projected?

14 AGRICULTURE ECONOMIST GOSSARD: Yes.

15 MS. STROUP: I think that that's a proprietary  
16 issue that I can't share. But if I can share it, and I  
17 will check, I will put it in a post-hearing brief.

18 AGRICULTURE ECONOMIST GOSSARD: Thank you very  
19 much. No further questions.

20 HEARING OFFICER KRUG: Ms. Reed?

21 SUPERVISING AUDITOR REED: No questions.

22 HEARING OFFICER KRUG: Ms. Gates?

23 RESEARCH MANAGER II GATES: Just one.

24 Ms. Stroup, on page 10 when you spoke to the  
25 distressed milk in California and what was going on, if

1 there's any documentation to that, could you include that  
2 in the post-hearing brief, when you were talking to the  
3 hauling companies?

4 MS. STROUP: Could it logs of phone calls?

5 RESEARCH MANAGER II GATES: That would be great.

6 Thank you.

7 HEARING OFFICER KRUG: Mr. Ikari.

8 DAIRY MARKETING BRANCH CHIEF IKARI: No

9 questions.

10 HEARING OFFICER KRUG: Thank you very much, Ms.

11 Stroup. You're excused.

12 Our next witness is Sharon Hale. Would you

13 please come forward.

14 Is the witness ready?

15 MS. HALE: Yes.

16 HEARING OFFICER KRUG: Thank you. Will the  
17 witness please state your name and spell your last name  
18 for the record.

19 MS. HALE: Sharon Hale, H-a-l-e.

20 HEARING OFFICER KRUG: Ms. Hale, do you swear or  
21 affirm to tell the truth?

22 MS. HALE: I do.

23 HEARING OFFICER KRUG: Are you representing any  
24 organization today?

25 MS. HALE: Yes, Crystal Cream and Butter Company.

1 HEARING OFFICER KRUG: Could you please tell us  
2 how your testimony was arrived at today.

3 MS. HALE: The testimony was written by myself  
4 and approved by our president.

5 HEARING OFFICER KRUG: And is this testimony to  
6 be considered the testimony of Crystal Cream and Butter?

7 MS. HALE: Yes, it is.

8 HEARING OFFICER KRUG: Thank you very much.

9 Do you have any written statements or other  
10 things you would liken entered into the record at this  
11 time.

12 MS. HALE: Yes the one that I handed to you just  
13 a minute ago.

14 HEARING OFFICER KRUG: Thank you. I have a  
15 document here, Consolidated Public Hearing dated June 1 -  
16 2, 2006. It's Labeled Exhibit number 71 and is now  
17 admitted in the record.

18 (Thereupon the above-referenced document was  
19 marked as Exhibit 71.)

20 HEARING OFFICER KRUG: You may proceed.

21 MS. HALE: Thank you.

22 Mr. Hearing officer and members of the panel, my  
23 name is Sharon Hale and I am vice president, dairy policy  
24 and procurement for Crystal Cream and Butter Company. Our  
25 administrative offices are located at 1013 D Street,

1 Sacramento, California. We operate 2 production  
2 facilities in Sacramento that produce fluid, cultured and  
3 frozen dairy products. Our primary distribution area is  
4 northern California, but we also export ice cream mix and  
5 ultra pasteurized fluid milk to other countries. Crystal  
6 is a privately held company and this testimony has been  
7 approved by our president.

8           At this point in a hearing of considerable  
9 complexity and voluminous documentation, the panel may  
10 well be relieved to learn not a single chart or graph is  
11 included in my testimony.

12           (Laughter.)

13           MS. HALE: We simply felt the events this spring  
14 involving Crystal and the independent producers who supply  
15 our milk were unique, at least in my 22 years with the  
16 company, and relevant to the call of the hearing. Perhaps  
17 the Department will find them useful in its deliberations.

18           Manufacturing allowances. This hearing  
19 represents a mile-marker for Crystal, as it's the first  
20 hearing to be held without our company having a personal  
21 stake in the absolute level of the manufacturing allowance  
22 selected for use in the Class 4a formula.

23           Crystal ceased nonfat dry milk production in  
24 2002, and earlier this year stopped producing butter. In  
25 both cases, we were simply priced out of the business as

1 other manufacturers chose to grow and we did not. The  
2 economies of scale and the larger plants were reflected in  
3 manufacturing costs collected by the Department and  
4 subsequently translated into manufacturing allowances that  
5 were too low to sustain our operations. This was textbook  
6 economics and clearly an anticipated outcome.

7           Since abandoning the dryer, your approach to milk  
8 balancing has been to keep our independent supply at a  
9 point where minimum needs are covered and additional needs  
10 are met with supplemental purchases on an as-needed basis.  
11 This worked fairly well as we were able to place the  
12 seasonal excess -- we do a lot of school milk -- in local  
13 manufacturing facilities with relative ease. Our  
14 independent producers continued to grow, but periodic  
15 dairy departures often to urbanization created space for  
16 those who remain.

17           That was before 2006. Shifts in retail business  
18 and operational changes pushed our needs downward as  
19 dairies continued to grow. In February, we discussed our  
20 concerns about excess milk with large manufacturers and  
21 were given assurances that they would be able to help us  
22 out when the need arose. Feeling somewhat comfortable,  
23 our first calls went out during Easter vacation in April,  
24 only to be met with sizable limitations due to the lack of  
25 available processing capacity. We eventually placed some

1 of the milk locally, moved some over 200 miles for  
2 processing and worked around the rest, which in turn  
3 causes operational and qualitative challenges that we had  
4 hoped to avoid.

5           By early May, we were able to anticipate the  
6 amount of excess milk we would generate due to schools  
7 going out for the summer and the flush volumes expected  
8 from our dairies. With this, we combined the cost of  
9 disposing of this milk and our bottom line fear that space  
10 would simply not be available to handle our excess milk.  
11 At that point, we made an extremely difficult decision  
12 that was not made quickly nor taken lightly. We notified  
13 our dairies they would be held to contract, thereby  
14 sharing the burden of excess milk with those who had  
15 increased their production over contractual amounts.

16           I tell this story because it's current and  
17 factual. Right now manufacturing capacity in the state is  
18 at a premium. Dr. Schiek of the Dairy Institute discussed  
19 in his testimony the need to attract investment into  
20 manufacturing facilities if California's dairy farmers are  
21 to grow in the future. Based on our experience, it seems  
22 critical that existing capacity be retained as well  
23 through adjustments in manufacturing allowances to reflect  
24 the current costs of converting milk in to butter, nonfat  
25 dry milk and cheese and urge the Secretary to use the

1 Department's own audit information and documented  
2 information from this hearing to make such a finding.

3           It's unfortunate I was unable to spare 2 days to  
4 listen to all the testimony at this hearing. I need to  
5 understand the thinking behind some of the alternative  
6 proposals, which advocate raising prices. We know  
7 producer prices are very low at this time, but how is the  
8 dairy producer to understand the market if not through  
9 price. Mandatory reductions on a selected basis will  
10 quickly create the "haves" and the "have nots" and  
11 generate another whole host of problems for the industry.  
12 And while higher prices signify the current volume of milk  
13 is okay and producers should carry on despite the very  
14 real possibility there will be no local home for that  
15 milk? I must admit, I am anxious to understand this  
16 perspective.

17           Class 2 and 3 prices. In light of the fact that  
18 neither the original petition nor the alternative  
19 proposals for this hearing suggest altering the current  
20 relationship between Class 4a and Class 2 and 3 prices, we  
21 do not feel it necessary to address this issue in any  
22 length. We simply wish to go on record as supporting the  
23 status quo relative to the price relationships between  
24 these classes. Our expectation is that any adjustments  
25 made to Class 4 prices as a result of this hearing will

1 carry forward for the current pricing formulas to Class 2  
2 and 3. In addition, as a consolidated hearing, we  
3 anticipate changes would impact prices on an equal basis  
4 in both marketing areas.

5 That concludes my written testimony. I thank you  
6 for the opportunity to express my company's views and  
7 welcome any questions you may have.

8 HEARING OFFICER KRUG: Thank you, Ms. Hale.

9 Would you like the opportunity to file a  
10 post-hearing brief?

11 MS. HALE: Yes.

12 HEARING OFFICER KRUG: Your request is granted.

13 Do we have any questions for this witness?

14 Mr. Gossard.

15 AGRICULTURE ECONOMIST GOSSARD: On the last page  
16 of your testimony as regards to Class 2 and 3, with your  
17 understanding that the relationship between 2 and 3 and 4a  
18 will remain unchanged, would you therefore oppose any  
19 increase in the 4a price, based on its impact on Class 2  
20 and 3?

21 MS. HALE: Well, we wouldn't relish it, but at  
22 this point in time we are wedded to the current  
23 connection, based on the way of this hearing and this  
24 process thus far.

25 AGRICULTURE ECONOMIST GOSSARD: Have you had any

1 competitive problems with the current level of 2/3 prices?

2 MS. HALE: We have an ongoing competitive issue  
3 in these products, and I have testified to that in the  
4 past. Basically though, some of those, particularly the  
5 Class 3 products are storable and transportable, and do in  
6 fact come in from other states. Class 2 products as well  
7 as sour creams easily come in from out of state, other  
8 cultured items. Yogurts come in from out of state. And  
9 it's not a situation that has improved through the years.  
10 We continue to get more and more national providers of  
11 these items and we see that more so in the marketplace  
12 than we ever have in the past.

13 AGRICULTURE ECONOMIST GOSSARD: Thank you. No  
14 further questions.

15 HEARING OFFICER KRUG: Any additional questions  
16 for this witness?

17 Mr. Ikari.

18 DAIRY MARKETING BRANCH CHIEF IKARI: Let me see  
19 if I can ask Tom's question in a different way. If the  
20 Department decision resulted in a decrease in the Class 4a  
21 price, I assume that Crystal would be in favor, as you've  
22 testified. But assume that the Department's decision on  
23 Class 4a price resulted in an increase in the Class 4a  
24 price, would your position -- your company's position be  
25 the same?

1           MS. HALE: I think, as I indicated, it's not  
2 something that we relish. We don't want the prices  
3 actually to go up and change our competitive position, but  
4 I don't believe that this -- the way this hearing has  
5 progressed to this point that the rest of the industry  
6 addressed this issue well enough probably for you to make  
7 that decision.

8           DAIRY MARKETING BRANCH CHIEF IKARI: Okay. I  
9 wondered if you could provide, and you can do it in a  
10 post-hearing brief, but if you can give us any -- put it  
11 in terms of numbers percentage, when you notified your  
12 dairies that they would be held to the contract, how much  
13 was that excess production going to be cut back or what  
14 percentage of what you were receiving?

15           MS. HALE: The total amount may well be somewhat  
16 proprietary, but I can tell you that a good number of the  
17 producers it will not impact at all, because of the way  
18 their operations are situated now compared to our contract  
19 period is based on October, November and December. We  
20 went from 0 up to 15.9 percent, and that was based on  
21 production that we had received from these same dairies  
22 the first week of May. And now that the end of May has  
23 come, their production has increased even more so, so  
24 those percentages are probably off a bit. So some of them  
25 had a significant decision to make because of the impact

1 and others it was minimal.

2           DAIRY MARKETING BRANCH CHIEF IKARI: Have  
3 producers given you notice for that because of that reason  
4 or --

5           MS. HALE: Yes, we have had a variety of  
6 responses certainly and we understand very well. Their  
7 initially actions were shock, anger, those sorts of  
8 things. We have told them all that we want them to make  
9 decisions that are appropriate for their business.  
10 Because we started the process, they have to make  
11 decisions now that will keep them viable. And so we have,  
12 in fact, received notice from 2 shippers that they can't  
13 live with this. We have one, I know of, and one probably  
14 and maybe one more by today that has made the decision to  
15 ship to us their contract amount and then ship to someone  
16 else the additional portion. And then we have I know of  
17 one that has already sold a significant number of milking  
18 cows and we have some that are looking at nutritional  
19 solutions. So they have chosen a variety of ways to come  
20 in to compliance. And our deadline is the 15th of June,  
21 so we're right at a period where we are learning what  
22 their choices are.

23           DAIRY MARKETING BRANCH CHIEF IKARI: Thank you.

24           HEARING OFFICER KRUG: Any additional questions  
25 for this witness?

1 Not seeing any additional questions, thank you  
2 very much Ms. Hale.

3 MS. HALE: Thank you.

4 HEARING OFFICER KRUG: You're excused.

5 Our next witness is Case Van Stein.

6 Is the witness ready?

7 MR. VAN STEYN: Yes.

8 HEARING OFFICER KRUG: Mr. Van Steyn, would you  
9 please state your full name and spell your last name for  
10 the record.

11 MR. VAN STEYN: My name is Case Van Steyn and the  
12 last name is V-a-n space S-t-e-y-n.

13 HEARING OFFICER KRUG: Thank you, Mr. Van Steyn.  
14 Do you swear or affirm to tell the truth?

15 MR. VAN STEYN: Yes.

16 HEARING OFFICER KRUG: Are you representing any  
17 organization today?

18 MR. VAN STEYN: I'm support -- I'm the president  
19 of Western United Dairymen. I'm supporting their  
20 testimony, but not in detail, just as supporting their  
21 position.

22 HEARING OFFICER KRUG: So you're not representing  
23 Western United Dairymen?

24 MR. VAN STEYN: In my comments today I'll  
25 represent myself.

1           HEARING OFFICER KRUG: Thank you. Do you have  
2 any written statements or other things that you would like  
3 to be admitted?

4           MR. VAN STEYN: No, I do not.

5           HEARING OFFICER KRUG: Okay. Thank you. You may  
6 proceed.

7           MR. VAN STEYN: Our family has been in the dairy  
8 business since -- in California since the 1950s and this  
9 is not forte testifying and I didn't prepare anything on  
10 purpose. I had some notes and I tossed them to be able to  
11 do this. So it reminds me of recently a friend of mine or  
12 another person told me that if you're not at the table,  
13 you'd probably be on the menu, so I decided to attend this  
14 function and see if I can get through it.

15           We've been in the dairy business since the  
16 fifties. I have witnessed, when I was a few years  
17 younger, what happens when you have a home for your milk  
18 or a contract one day and no contract the next, and how  
19 that affects families and dairy people, employees, et  
20 cetera, and how those frustrations and stresses go  
21 forward. And we have worked, myself included, and the  
22 dairy industry, to come up with a system in California  
23 that in my opinion is probably one of the premier  
24 systems -- one of the best systems in the world that I've  
25 ever heard of being -- having a stable system, a -- with

1 some -- with a quality product, delivered to the consumer  
2 at a reasonable price. And I do believe that we have  
3 maintained with tweaks and pulls and tugs accomplished  
4 that.

5           And we have had issues with out-of-state pricing  
6 or out-of-state milk moving around. And slowly but  
7 surely, you can win some you lose some, we keep coming  
8 around to the -- you know, it ends up where we can live  
9 with it or adjust to it or make it work or continue  
10 litigation. You can always do that, but that, as we all  
11 know, that's expensive.

12           And, you know, the system we have we didn't get  
13 there by accident. It's slowly -- we added things to the  
14 formulas, if you want -- you know talking about whey and  
15 the potential in the discussion of taking it in or out.  
16 We've added things and taken things away and tweaked here  
17 and there, and it's still working.

18           Right now the prices are at an -- not maybe  
19 all-time low, but they're pretty darn bad. So you better  
20 have a good relationship with your bank if you're in the  
21 dairy business today, because that's where it's going to  
22 be at. If they won't support you, you're not going to be  
23 around long.

24           We assumed that the future will adjust and the  
25 things will come around. But when we have a system like

1 we have, my distress or my concerns are that some of the  
2 comments I'm hearing we seem to have an attitude of maybe  
3 dismantling it or slowly pulling and tugging at it that  
4 will cause pressures that could end up unraveling it, and  
5 that's a very critical concern of mine, because I remember  
6 what it was like when we didn't have any security as a  
7 dairy farmer. When you invest in a cow or a calf today,  
8 you're looking out 3 years, 2 to 3 years, to get any  
9 return and longer actually to cash flow that particular  
10 animal, as with feed and facilities and building -- adding  
11 facilities.

12           So it's not a price cycle thing. You make  
13 commitments for a lot longer. And we need and we have  
14 gained some stability through pooling and pricing that are  
15 even, you know, better than a lot of things in the federal  
16 order, where you have depooling and things that can tweak  
17 it the other way from a -- to an advantage for somebody  
18 else.

19           And I'm -- there are adjustments that need to be  
20 made, I'm sure, in time. But I'm very concerned that at  
21 this time with the prices where they are, that making  
22 significant changes followed in the proposal by the  
23 Institute are going to hurt the California dairy industry  
24 farther than we can anticipate today and will have longer  
25 term effects. We have needs, and I understand those, and

1 I'm willing to discuss those or listen to those. But  
2 basically lowering prices for -- at point in time when  
3 it's already at a very negative state it's hard for me to  
4 understand or why we would want to go there when the basic  
5 needs I see is that processors are on a level playing  
6 field and have an equal advantage in competition with each  
7 other. And we should maintain some relationship with  
8 surrounding states on pricing.

9 And I think that we are not out of range in those  
10 areas. We're not getting into specifics, because I didn't  
11 bring any notes with me purposely, so that I wouldn't get  
12 caught in that trap because my numbers are -- there's  
13 better people out here, including Tiffany and Mike that do  
14 the numbers than I probably could.

15 So anyway those probably are my thoughts is that  
16 if you guys when these decisions are made could  
17 specifically consider those parts of it that we -- the job  
18 of doing these hearings and moving forward on these things  
19 is also to protect the consumers, protect a quality, a  
20 viable supply of milk at a reasonable cost and  
21 relationship. And in most things I found bottled water  
22 higher than milk, so I think that relationship is probably  
23 adequate.

24 And those are the benefits of the hearing process  
25 is also to look out towards the future and accomplish

1 things that as they might impact the future of the dairy  
2 business. I think I covered my basic points. If I missed  
3 anything, I'll be happy to reconsider.

4 HEARING OFFICER KRUG: Thank you very much, Mr.  
5 Van Steyn. Would you care for the opportunity to submit a  
6 post-hearing brief?

7 MR. VAN STEYN: Not at this time.

8 HEARING OFFICER KRUG: No request?

9 MR. VAN STEYN: No.

10 HEARING OFFICER KRUG: Okay. Are there any  
11 questions for the witness?

12 AGRICULTURE ECONOMIST GOSSARD: No.

13 HEARING OFFICER KRUG: Not seeing any questions,  
14 Mr. Van Steyn, you're excused.

15 Thank you very much.

16 MR. VAN STEYN: You guys let me off easy, so  
17 that's good.

18 Thank you.

19 HEARING OFFICER KRUG: Our next witness is Ray  
20 Souza.

21 MR. SOUZA: My name is Ray Souza. I'm a dairy  
22 producer -- third generation dairy producer --

23 HEARING OFFICER KRUG: Excuse me. Just so I can  
24 get you to go through the formalities.

25 MR. SOUZA: I'm sorry. I was in a hearing last

1 night till quite late, so I'm a little off balance. I'm  
2 ready to finish this thing.

3 HEARING OFFICER KRUG: You're in the starting  
4 gate. Okay. Would you please state your full name and  
5 spell your last name for the record.

6 MR. SOUZA: My name is Ray Souza. Last name  
7 S-o-u-z-a. I'm a dairyman in Turlock, California.

8 HEARING OFFICER KRUG: Okay. Thank you.

9 Do you swear or affirm to tell the truth?

10 MR. SOUZA: Yes, I do.

11 HEARING OFFICER KRUG: Are you representing any  
12 organization today?

13 MR. SOUZA: I'm a member of Western United. I'm  
14 currently their vice president. I support their  
15 testimony, but I will be testifying on my own behalf.

16 HEARING OFFICER KRUG: Do you have any written  
17 statements or other things you would like entered at this  
18 time?

19 MR. SOUZA: The only thing I have written is some  
20 notes and you wouldn't be able to understand my  
21 handwriting or read my handwriting anyway.

22 HEARING OFFICER KRUG: Okay. Thank you very  
23 much. You may proceed.

24 MR. SOUZA: Thank you. As I said, my name is Ray  
25 Souza. I'm a third-generation dairy farmer from Turlock,

1 California. I'm here really to speak to the issue of  
2 plant capacity and how it relates to the testimony here.

3           In my family, the first generation, my  
4 grandfather, when he spoke of tough times, he talked about  
5 the hoof and mouth disease, which took his herd out many,  
6 many years ago. My father, the second generation, when he  
7 spoke of hard times, he spoke of the pre-pooling  
8 inequities that he dealt with as a family and how  
9 fortunate we are to have a pooling system in California  
10 that works as well as it does.

11           I speak about plant capacity. I lived through  
12 the time in California when there simply wasn't enough  
13 plant capacity and we had to move milk and find a home for  
14 it wherever we could. In those days, of course, it didn't  
15 travel quite as far as it can today, but it was still an  
16 issue. I am very well aware of the serious problems that  
17 limited plant capacity can bring to California.

18           Unfortunately, I believe that some of my producer  
19 friends still believe that somehow restricting plant  
20 capacity will somehow raise prices to producers. I'm here  
21 to tell you, as living through it, it doesn't. And I keep  
22 talking about living through it, I feel like I'm talking  
23 about history. And as I look at my fellow dairymen and  
24 look at their hair coloring, and I look at my own I kind  
25 of feel like I'm the Taylor Hicks of the dairy industry.

1 I'm the gray-haired guy now, so I can talk a little bit  
2 about history.

3           The idea of raising -- of restricting plant  
4 capacity and somehow producing a less finished product  
5 while raising the price to producers is strictly a  
6 fallacy. The experience that I had was that we were  
7 pretty clever in finding ways of getting our milk  
8 processed. We had milk moving out of state. I know  
9 personally at some point in time I had milk going to Idaho  
10 at a cost of about \$6 a hundredweight, which was just  
11 about the entire price of milk I was getting at the time.

12           So that's what led to this whole issue of how  
13 were we going to handle it, and we developed the cheese  
14 industry and part of that was the make allowance. And I  
15 think the make allowance in conjunction with developing a  
16 new market, the cheese industry, which we really weren't  
17 players in the cheese industry, was very successful. We  
18 are a major cheese producer today, as you know. The  
19 second largest cheese producer in the nation and probably  
20 soon to become the leading cheese producer in the nation.

21           So I think the argument that it's not a friendly  
22 climate for cheese producers, we have to examine that  
23 closely, because history doesn't tell us that. We've had  
24 an expanded cheese market and an expanding ability to  
25 produce cheese.

1           I can tell you that I make a living -- I'm not an  
2 economist, as you clearly can tell. I make a living  
3 milking cows. We milk cows. We try to pay our bills. We  
4 raised our family. We put our children through school.  
5 It appears that I may be the last one willing to do so.

6           But I'm concerned. I'm still -- just the same,  
7 I'm very concerned about the future. This decreasing  
8 price of living through now -- someone said earlier today  
9 that it's an unfortunate time to lower milk producers. I  
10 think that's terribly understated. That to me is equal to  
11 saying Napoleon picked an unfortunate time to go to  
12 Waterloo. It's disastrous. We cannot take another hit.  
13 We are far below the cost of production.

14           The cost of production today we're looking at --  
15 we're typically -- dairy farmers are generally -- at least  
16 like to talk about price, but we're far below -- price  
17 isn't the issue. It's the margins that are the issues.  
18 We've seen these kind of prices before, but not with these  
19 kind of expenses. Hay costs are at an all-time high, and  
20 you've heard this before. And it is doesn't look like  
21 it's going to get any better. The future tells us now  
22 that we're going to be dealing with competition for our  
23 corn. In looking at corn next year, I contracted corn 2  
24 years ago for \$105. Next year's corn price is \$140.

25           We thought that our \$200 premium hay cost last

1 year was a temporary issue. They're not. The delayed  
2 rains this year in the spring have basically for all  
3 practical purposes ruined the hay crop in California. My  
4 brother deals in some hay, he's telling me he's having  
5 trouble finding hay over 53 or 54 percent total TD, Total  
6 Digestible, nutrients, and that's really inferior hay. So  
7 we don't -- I don't see these prices coming back, as far  
8 as our costs go.

9           When I talked -- yesterday I had lunch with a  
10 banker. He's kind of a portly guy and he usually has a  
11 big lunch. He really wasn't in to eating lunch yesterday.  
12 And I asked him what the problem was. And he was very  
13 upset. He was going to see one of his old friends, one of  
14 his old customers and count his cows because they're  
15 taking him out of business. The milk production is going  
16 to slow down.

17           This is an industry that doesn't stop on a dime.  
18 It's like trying to stop a train, as opposed to trying to  
19 stop a Volkswagen. It takes time to reduce -- to cut down  
20 production. And we don't do it individually. We don't  
21 sit there and look at our operation and say well, we need  
22 to reduce our production by 10 percent. We can't afford  
23 to do that. We need to maintain certain efficiencies.

24           The way this industry slows down is you take  
25 out -- individual producers go out of business, and that's

1 how it's going to slow down, but that takes time. And so  
2 the rest of us have to wait through -- those of that  
3 survive. And I don't know that I'm going to and I don't  
4 know that anyone in this room is going to, even the  
5 producers here. But to do that we just -- it's a game of  
6 attrition. And once it does turn around we're all  
7 injured. It takes a long period of time for us to  
8 recover, even those that do recover.

9 But I will tell you, even though as concerned as  
10 I am with the plant capacity. And it's an issue that has  
11 been long held by me as an important issue -- being  
12 again -- having been seriously affected by that. I don't  
13 know that reducing make allowances or devaluing producer  
14 commodity prices values in their milk at this particular  
15 time is a way to do that. That is not a long-term  
16 solution to plant capacity.

17 As I stated before, the make allowance system is  
18 a wonderful system. I think we have the premier system in  
19 the country. It is designed to keep plants in California.  
20 But it was successful only because we had a second  
21 component with that. We were committed to an expanding  
22 cheese industry. Those 2 together are what led to the  
23 success. Increasing make allowances to keep cheese plants  
24 or any type of plant afloat, that alone is not a long-term  
25 solution. If we break -- if we do make this

1 significant -- what I believe to be a significant policy  
2 change, I think it could lead to some very serious  
3 consequences down the road.

4           If producers or plants get the idea that we can  
5 at anytime that we need to -- that we're going through  
6 some economic difficulties, we can come to a hearing and  
7 basically extort monies from the processor -- producers  
8 from the processor or conversely processor from the  
9 producer, I hope we're ready to hold a hearing every week.  
10 I think that will lead to additional hearings. I think it  
11 will change the entire flavor of hearings, and I think it  
12 could further divide our industry.

13           I think that this hearing's decision today has to  
14 be based on the evidence presented, the cost verifications  
15 for make allowances, and be careful that we don't  
16 undervalue the commodities in our milk strictly for the  
17 purpose of increasing plant capacity. We need to keep the  
18 2 issues divided. I also would suggest that I think out  
19 of this hearing -- one of the good things that's going to  
20 come out of this hearing is raising the issue of plant  
21 capacity, because it's kind of been something that  
22 producers don't generally talk about when they're trying  
23 to deal with \$10 overbased milk and \$200 hay and \$140  
24 corn, plant capacity -- once that milk leaves their farm,  
25 out of sight, out of mind.

1           I think this hearing is going to be very helpful  
2 in a sense it's going to raise that issue, that you'll see  
3 producers talking about it, and understand the importance  
4 of it. And I hope out of that, we can get to a reasonable  
5 long-term solution through a good industrywide strategy,  
6 comprehensive strategy, that's going to include producers  
7 of all commodities -- or processors of all commodities and  
8 producers as well, so we can get to a real solution for  
9 our plant capacity issue, without trying to tweak it  
10 through some kind of make allowance formula change or a  
11 devaluation of a particular commodity.

12           With that, that concludes my comments.

13           HEARING OFFICER KRUG: Thank you. Mr. Souza  
14 would you like the opportunity to present a post-hearing  
15 brief?

16           MR. SOUZA: I don't believe so.

17           HEARING OFFICER KRUG: Okay. Thank you very  
18 much. Are there any questions for the witness?

19           AGRICULTURE ECONOMIST GOSSARD: No.

20           HEARING OFFICER KRUG: Not seeing any questions,  
21 you're excused. Thank you very much.

22           Our next witness is David Inman.

23           Is the witness ready?

24           MR. INMAN: Yes.

25           HEARING OFFICER KRUG: Mr. Inman, would you

1 please state your full name and spell your last name for  
2 the record?

3 MR. INMAN: My name is David Inman, I-n-m-a-n.

4 HEARING OFFICER KRUG: Thank you. Mr. Inman, do  
5 you swear or affirm to tell the truth?

6 MR. INMAN: I do.

7 HEARING OFFICER KRUG: Are you representing any  
8 organization today?

9 MR. INMAN: Well, I am a member of California  
10 Dairy Campaign and I support their testimony. I'm a dairy  
11 producer and I also am a co-founder of a group of producer  
12 friends we call U.S. Milk.

13 HEARING OFFICER KRUG: Are you representing them  
14 or is your testimony on your own behalf?

15 MR. INMAN: I am U.S. Milk. It's just my  
16 friends, so I'm presenting testimony today as a dairy  
17 producer.

18 HEARING OFFICER KRUG: Okay. Thank you very  
19 much. Do you have any written statements or other things  
20 you would like entered into the record?

21 MR. INMAN: Just my testimony.

22 HEARING OFFICER KRUG: Okay, and that's the  
23 document that you just passed out to the hearing panel?

24 MR. INMAN: Yes, sir.

25 HEARING OFFICER KRUG: I have a document here.

1 It's dated June 2nd, 2006, identified as from David Inman.  
2 It is labeled Exhibit number 72 and is admitted in to the  
3 record.

4 (Thereupon the above-referenced document was  
5 marked as Exhibit 72.)

6 HEARING OFFICER KRUG: You may proceed with your  
7 testimony.

8 MR. INMAN: Okay. I'd like to preface this  
9 testimony that some of these, where I was informed I would  
10 only have 3 minutes to testify, so I made a statement here  
11 kind of as a -- a lot of -- some of this is tongue and  
12 cheek, but it is a little bit harsh and very quick,  
13 because I knew my time would be limited, so I apologize,  
14 but --

15 HEARING OFFICER KRUG: This is not the 3-minute  
16 period. You have your full 20 minutes.

17 MR. INMAN: Thank you, I appreciate that.

18 Mr. Hearing Officer and panel, my name is David  
19 Inman. I'm a broke dairyman currently residing in  
20 Turlock, California. My testimony before you today is  
21 based on my sincere and honest efforts to support all  
22 dairy farmers and their issues.

23 Many times I've been asked to testify or  
24 volunteer to testify in hopes that I may somehow trigger a  
25 change in a system that's severely flawed. Since my

1 future as a dairyman in this state draws closer to a  
2 bitter end, I believe it is my duty to point out and shed  
3 some light on several inequities facing the California  
4 dairy farmer.

5           As I use up my 3 minutes -- in this case 20  
6 minutes -- so the processors can have their 30 minutes to  
7 testify, I apologize I must be very direct and somewhat  
8 politically incorrect in my statements.

9           Today's hearing is a farce. Since I became  
10 involved in the political aspect of dairy farming in 1998,  
11 it has become evident to me that our industry is on a path  
12 to self destruction. I wouldn't give a dollar for the  
13 California dairy farmer's future under the pricing control  
14 that California Department of Food and Agriculture's Dairy  
15 Marketing Branch. The reason I say this is because this  
16 Department's past and current actions have been calculated  
17 only to help processors stay profitable without market  
18 accountability, which is the same rod you should measure  
19 us producers with.

20           We need a floor on Class 4a and 4b that would be  
21 based on our cost for production, according to CDFA's cost  
22 survey analysis, and don't forget to add the 10 percent  
23 return on investment. I believe this Department could not  
24 have chosen a better time to show its true colors than to  
25 call a hearing to review their Dairy Institute's proposal

1 at a time when milk prices are so low.

2           This Department has transposed into a grand soup  
3 line where processors seek raises in their make allowance,  
4 welfare checks, and using this same milk make allowance  
5 money to come beg for more make allowance, and at the end  
6 of the year these begging efforts count as costs and this  
7 Department audits them and will show -- and will somehow  
8 justify their bleedings and give them another raise to  
9 make up for the money they spent begging for more.

10           This is, my friends, is a processor's grand  
11 casino. This Department's unethical changes to pricing  
12 formulas in recent years that included so-called energy  
13 indexing, transportation allowances and increased  
14 manufacturing allowances are systematically eliminating  
15 the dairymen from this state. It seems every time we come  
16 up here to the casino to testify we lose more money.  
17 That's because we can't afford to play the high-limit  
18 table and we're forced to play for nickels and pennies.

19           This hearing today is an immoral action, and I'll  
20 reference the Bible, which I believe is the highest  
21 stabilization plan, particularly the 27th through the 37th  
22 Psalm, in which I invite all of you to read tonight with  
23 your family.

24           Additionally, this Department refuses to address  
25 the disparity between the federal order price and the

1 California price when we are already approximately 40  
2 cents below the neighboring federal order price. This  
3 Department has stated they are required to review the  
4 pricing formula when the California order price goes above  
5 the neighboring federal order price. Why is the  
6 Department refusing to review it and adjust it back up to  
7 the price in the neighboring federal order.

8           We dairymen are paying to haul our product to a  
9 processor. We pay almost \$2 a hundredweight to process  
10 their finished product that we do not market. We pay 15  
11 cents to an agency that helps to advertise a dairy product  
12 only when they feel like it. When then pay a  
13 transportation allowance for the processor to get rid of  
14 his or her product. And then if they're energy cost goes  
15 up, we pay that too. If the processor loses money,  
16 because their CEO built a gazebo in his backyard from wood  
17 he took from the plant, I know the trend here, we pay that  
18 too plus 10 percent return on investment.

19           With this in mind, my suggestion to every  
20 dairyman in this room is if we join the federal order and  
21 use this Department's budget to buy off the quota that  
22 producers are holding with the value returned to the  
23 order, we could pay some of our bills.

24           This Department's inability and unwillingness to  
25 stop the use of illegal and potentially dangerous

1 additives, such as milk protein concentrate in  
2 standardized and nonstandardized foods or enforce  
3 California fluid standards that producers pay for, in  
4 order to help protect our California milk -- California  
5 markets is appalling.

6           This Department's stabilization plan is anything  
7 but stable. Today, we producers are double-dipped on  
8 energy costs and fuel charged 9 ways to Sunday. We have  
9 no mechanism in place nor a Department of Food and  
10 Agriculture willing to be innovative in order to index  
11 back our costs with a floor price or review a variable  
12 make allowance or consider allowing our beloved processors  
13 to stand on their own 2 feet by eliminating the  
14 manufacturing allowance altogether. You could call this a  
15 dairyman viability plan.

16           I am not a hypocrite, in a sense that I know I  
17 get a little welfare check too. The creamery I ship to  
18 has said many times that MILC program is wrong, since it  
19 allows a producer protection from the natural market  
20 changes and it subsequently hurts the majority of  
21 producers by allowing lower-end producers, such as myself,  
22 to stay in business. This is a poor statement for any  
23 processor to make, since my little MILC payment isn't  
24 equal to half his make allowance on my milk. Once again,  
25 the dairymen pays.

1           The state's largest trade association had an  
2 official quoted in an article stating that the MILC  
3 program encouraged milk production in areas where it was  
4 not needed. What kind of BS is this? In this state, we  
5 have to export 50 percent of the products we produce to  
6 states elsewhere and the producers get the privilege of  
7 paying to haul it there, thanks to CDFA implemented  
8 transportation allowances.

9           It appears he did not think before he opened his  
10 mouth. He obviously still subscribes to this Department's  
11 antiquated theory that milk shouldn't be produced by  
12 smaller dairy farmers in other states and that California  
13 producers could subsidize our California plants to steal  
14 their market share. But those little dairy farmers in  
15 other states fought back and responded by lowering their  
16 producer price and shafted us back and then we adjust our  
17 plan to mirror their plan. And here we are 25 years later  
18 back and forth. We're making \$2 less a hundredweight than  
19 we were -- than in 1978. Good job guys.

20           In the last 3 years there's been an organization  
21 called CWT. The dairymen pays this organization so that  
22 herds in this country could be bought and sold, sent to  
23 beef or allow a failing producer or one that ready to  
24 retire to get out of business and eliminate the surplus  
25 milk.

1           This, too, is another grand casino for the  
2 processor, because these same people running this  
3 organization are testifying here as processors, and  
4 tomorrow they'll go back to their office and change their  
5 ads and pretend to represent farmers while running CWT.  
6 Then they'll put on their processor hat again and import  
7 milk protein concentrates in order to illegally replace  
8 milk from cows that went to slaughter and drive our price  
9 down, so they can ask for more money to do it all over  
10 again. This systematically eliminates American dairy  
11 farms with the cooperative efforts and their producers pay  
12 for this too.

13           Which country does this CWT program help? Am I  
14 the only person that noticed that every time the CWT has a  
15 buyout, the milk price goes down? The reason for this  
16 phenomenon is that when the CWT program is announced it is  
17 also a call for the processors to increase their illegal  
18 imports in order to meet market needs.

19           In fact, we don't have enough cows in this  
20 country to feed our people. We have to import just to  
21 feed our country. It is evident to me that this  
22 Department has willingly entered into a race that will end  
23 up with its undoing. As dairymen go out of business one  
24 by one you will have less work to do, more time to play  
25 golf. Unless you're a great golfer, you're not going to

1 get paid much longer. With illegal immigrants and CRLA  
2 suing dairymen based on false accusations, OSHA laws and  
3 regulations, pending environmental regulation changes and  
4 air permit restrictions, my advice to this Department is  
5 to start looking for another industry to ruin.

6           You're about to completely ruin this one. In  
7 light of the happy cow lawsuits, the PETA peoples' antics  
8 and this hearing, I'm not sure which one is the most  
9 ridiculous today.

10           I will say, however, I think -- I must thank the  
11 California Milk Advisory Board for their adds that say  
12 very accurately and honestly, "Happy cows come from  
13 California." And to be "from" anywhere that means you had  
14 to leave there. For happy cows to come from California  
15 must mean they moved to another state.

16           Thank you.

17           HEARING OFFICER KRUG: Thank you, Mr. Inman.

18           You indicated that you prepared this testimony  
19 expecting to only have 3 minutes. You have another 10.  
20 Do you have anything you'd like to add?

21           MR. INMAN: No. Like I said, I must apologize  
22 for being a little bit direct, but I was thinking with my  
23 pocket book and my personal experience in this business,  
24 and my heart is broken as I'm going to be going out of  
25 business probably pretty soon.

1           HEARING OFFICER KRUG: Thank you for attending  
2 the hearing. Would you like the opportunity to present a  
3 post-hearing brief?

4           MR. INMAN: No, thank you.

5           HEARING OFFICER KRUG: Okay. Do we have any  
6 questions for this witness?

7           No questions for this witness. Thank you, Mr.  
8 Inman. You're excused.

9           MR. INMAN: Thank you.

10          HEARING OFFICER KRUG: Let ME call Albert Nunes  
11 again. Has he arrived?

12          Okay. At this time, we'll take a 10-minute  
13 break.

14          (Thereupon a recess was taken.)

15          HEARING OFFICER KRUG: Okay. We'll go back on  
16 the record now.

17          The Department has received an additional letter  
18 to be admitted in to the record. It will be presented by  
19 the Department's witness, Cheryl Gilbertson.

20          Ms. Gilbertson, would you please proceed.

21          STAFF ANALYST GILBERTSON: Yes, Mr. Hearing  
22 Officer. I have one letter received from Archie Dairy,  
23 dated May 24th, 2006, that I'd like to enter in to the  
24 hearing record. And there will be copies of this letter  
25 available at the back of the room.

1           HEARING OFFICER KRUG: Thank you very much. If  
2 you'll present the letter, it will be marked as Exhibit  
3 number 73.

4           (Thereupon the above-referenced document was  
5 marked as Exhibit 73.)

6           HEARING OFFICER KRUG: Exhibit 73 is now entered  
7 in to the record.

8           We will proceed with our next witness, Ms. Sue  
9 Taylor.

10          Ms. Taylor, are you ready?

11          MS. TAYLOR: Yes, I am.

12          HEARING OFFICER KRUG: Ms. Taylor, will you  
13 please state your full name and spell your last name for  
14 the record.

15          MS. TAYLOR: My name is Sue Taylor. Last name  
16 spelled T-a-y-l-o-r.

17          HEARING OFFICER KRUG: Thank you, Ms. Taylor.

18          So you swear or affirm to tell the truth?

19          MS. TAYLOR: I do.

20          HEARING OFFICER KRUG: Are you testifying or  
21 represent on behalf of or representing any organization  
22 today?

23          MS. TAYLOR: Yes. I'm testifying on behalf of  
24 the Leprino Foods Company, for which I'm the vice  
25 president of dairy policy and procurement and am primarily

1 responsible for formulating the company's positions. This  
2 testified has also been reviewed by some members of the  
3 senior management team.

4 HEARING OFFICER KRUG: Does your testimony  
5 represent the testimony of Leprino Foods?

6 MS. TAYLOR: It does.

7 HEARING OFFICER KRUG: Thank you. Do you have  
8 any written statements or other things that you would like  
9 entered in to the record at this time?

10 MS. TAYLOR: Yes, I do, and they have been  
11 distributed to the panel.

12 HEARING OFFICER KRUG: Okay. I have a document  
13 here, statement of Sue Taylor Leprino Foods dated June  
14 2nd. It's marked Exhibit number 74 and is now admitted in  
15 to the record.

16 (Thereupon the above-referenced document was  
17 marked as Exhibit 74.)

18 HEARING OFFICER KRUG: You may proceed.

19 MS. TAYLOR: I'm going to consolidate the  
20 introduction of my written testimony in terms of the  
21 background and our general position, which I could easily  
22 summarize to say that we are in support of the Dairy  
23 Institute proposal and in opposition to the balance of the  
24 proposals.

25 And I'm going to jump down to the bottom of that

1 first page. I'll focus my testimony on the following  
2 specific issues: Need for plant capacity; whey factor;  
3 yields; and price snubbers.

4           Need For Plant Capacity. The continued growth of  
5 milk production in California is well documented. This  
6 milk production growth will necessitate additional plant  
7 capacity in California. The ability to attract  
8 proprietary investment substantially reduced by the  
9 Department's Class 4b formula changes effective with April  
10 2003 milk.

11           Although the hearing decision effective with  
12 April 2005 milk removed the onerous support floor from the  
13 April 2003 decision and increased the whey make allowance  
14 modestly, the decision still failed to realistically  
15 reflect whey processing costs and locked and overstated  
16 cheese yield factor in place.

17           There are many factors that accompany whey when  
18 deciding where to locate a plant. Milk availability and  
19 price are 2 of the most critical factors we consider. The  
20 milk price must allow us to be competitive from a  
21 manufacturing facility in the national marketplace when  
22 considering the total cost of manufacturing and delivering  
23 the product to the customer from that location.

24           Our decision to build our newest facility in  
25 Lemoore was made in 1999, prior to the chilling effects of

1 the April 2003 decision. We constructed much of the  
2 infrastructure to facilitate cost effective expansion of  
3 milk throughput. This sunk investment and the scale  
4 efficiencies that are gained as a result of expanding and  
5 existing facility should make a decision to expand the  
6 Lemoore West facility an easy one.

7           However, the current milk price formulas and  
8 business environment in California have caused us to  
9 explore greenfield opportunities outside of California, as  
10 we explore options to satisfy our need for additional  
11 plant capacity. We believe that the data provided by CDFA  
12 for use at this hearing already understates the current  
13 California disadvantage because energy and transportation  
14 costs have continued to escalate beyond average 2005  
15 levels.

16           We believe that the prices received by processors  
17 FOB California is now lower than the prices received in  
18 2004 and 2005. This is because capacity constraints in  
19 the trucking industry due to driver shortages and DOT  
20 hours of service regulations, implemented a few years ago,  
21 and increased fuel costs have resulted in escalating  
22 transportation costs. Much of our California production  
23 is shipped into the southeast, either by truck or by rail.  
24 Our rates for rail shipments into the southeast have  
25 increased by a minimum of 15 percent from the 2004 to 2005

1 FOB price survey base period and have increased by 20  
2 percent at a minimum for rail from California to the  
3 southeast over the same period.

4           Our experience is that freight rates outbound  
5 from California are increasing at roughly double the rate  
6 of increase we are seeing outside of California. The  
7 greater distances that California products must be shipped  
8 to reach the ultimate consumer markets and the higher rate  
9 of increase in outbound hauling rates from California is  
10 resulting in an even greater transportation cost  
11 disadvantage on a per pound basis than ever before for the  
12 California source products.

13           We have not yet concluded our plant siting  
14 analysis and have therefore not made a decision regarding  
15 our next source of capacity. The current construction at  
16 the Lemoore West facility referenced by the CDC witness at  
17 this hearing will increase our line flexibility and will  
18 not result in expanded milk throughput capacity.

19           Whey Factor. Make Allowance. The Dairy  
20 Institute proposal cause for an increase in the whey make  
21 allowance to a level that is consistent with the  
22 Department cost studies is an initial step. This proposal  
23 is entirely consistent with the longstanding principle of  
24 establishing the make allowances in the minimum regulated  
25 milk price formulas, based upon the objective analysis

1 embodied by the cost studies.

2           The Department has now conducted 2 whey  
3 processing cost studies with very similar results. To  
4 reject these costs studies is tantamount to rejecting the  
5 longstanding and sound policy of the Department to rely on  
6 objective analysis to establish the appropriate make  
7 allowances in the milk price formulas.

8           Several pieces of evidence that were authored by  
9 either me or Venkat have been entered into the record by  
10 other witnesses at this hearing in an attempt to develop  
11 an alternative approach to establishing the make  
12 allowance. While I consider myself a poor substitute for  
13 Venkat, I will elaborate on this earlier testimony,  
14 because we tragically lost Venkat's wonderful presence and  
15 great talent to death last summer.

16           The reference pieces of evidence are mostly  
17 focused on the differences in energy and equipment costs  
18 for nonfat dry milk and whey processing plants of similar  
19 milk throughput. The testimony was submitted during  
20 hearings in which either there was a lack of whey cost  
21 data or in which there were significant questions  
22 regarding the validity of the available whey cost data.  
23 In these circumstances, we felt that it was helpful to  
24 develop an alternative approach as a frame of reference,  
25 even though we knew we were not capturing all of the

1 costs.

2           These pieces of evidence are largely irrelevant  
3 to this proceeding for a variety of reasons that are  
4 summarized below and I'll paraphrase some of these reasons  
5 from the table to get through it more quickly. Venkat's  
6 testimony from the May 2000 federal order hearing, which  
7 was attached to the MPC testimony focused on costs --  
8 energy costs that were outside of the State of California  
9 and in a much earlier timeframe. Additionally,  
10 these -- this testimony focused strictly on the difference  
11 in energy and equipment costs for the processing of whey  
12 versus nonfat dry milk. And in that testimony he  
13 specifically elaborated that there were additional costs  
14 in terms of labor and management and other costs that he  
15 did not attempt to capture in that cost study.

16           That same issue follows through to the Scott  
17 Burleson testimony from the January 2006 federal order  
18 hearing, which is the third item on the table. It was  
19 essentially an update of Venkat's cost study, but also did  
20 not attempt to capture all of the incremental costs. It  
21 was strictly from a technical approach on energy and  
22 equipment cost differences.

23           The post-hearing brief that I filed last  
24 February, as a result of the CDFA hearing, provided some  
25 data from our Allendale, Michigan and Waverly, New York

1 sweet whey processing facilities, where we had restated  
2 the key rates for energy, labor and some of the other  
3 major cost factors to California costs. While this, I  
4 think, is interesting, and we were hopeful that it would  
5 be helpful in the context of that hearing, where you had a  
6 cost study presented by CDFA that was the first time  
7 around and some people were questioning that cost study, I  
8 don't think that it's relevant in the context of CDFA now  
9 having 2 costs studies done on whey under the rigorous  
10 process that they conduct -- that essentially endorse and  
11 validate each other with consistent results.

12           And finally my post-hearing brief from the  
13 federal order hearing this January, a similar statement.  
14 This was put together and endorsed because in the federal  
15 order hearing in January there still was not an accurate  
16 whey cost study for whey processing plants outside of the  
17 state of California. Some advocates were looking at using  
18 Charlie Ling's data, which clearly was shown in the  
19 testimony to have lacked some aspects of the cost.  
20 Therefore, we were attempting to provide some point of  
21 reference recognizing that we weren't capturing all of the  
22 cost differences.

23           I'll proceed on to the text. The use of the  
24 incremental approach, nonfat dry milk plus energy and  
25 equipment cost differences to produce whey, to establish

1 the whey make allowance is a far less desirable approach  
2 than using an accurate cost study of whey processing  
3 costs. In addition to the noted omission of certain  
4 incremental costs in the Venkat and Burleson analysis,  
5 there is a significant mismatch of plant capacity between  
6 the average California nonfat dry milk plant, included in  
7 the cost study, and the average cheese plant.

8           Additionally, since roughly a third of the SNF is  
9 captured in the cheese and not available in the whey  
10 stream in a cheese plant, a cheese plant of comparable  
11 milk intake with a butter powder operation does not have  
12 comparable drying scale as the nonfat dry milk plant.  
13 Therefore, the base data for nonfat dry milk costs would  
14 significantly understate the cost of processing whey.

15           In contrast with the hearings for which the  
16 referenced testimony was prepared, CDFA has completed whey  
17 cost studies 2 consecutive years using a proven and  
18 rigorous methodology. The results of these cost studies  
19 are very close. Discarding CDFA's own cost studies in  
20 order to utilize an estimation method with the noted  
21 deficiencies would be wholly inconsistent with CDFA  
22 practices and would be poor policy.

23           Returns disconnect amongst various whey products.  
24 Sweet whey was historically viewed as the lowest common  
25 denominator amongst all whey products. This was because

1 it is the most generic whey product requiring the least  
2 advanced technology, and returns were generally lower than  
3 those for the more highly refined whey proteins. So long  
4 as the milk price was based upon the sweet whey prices, it  
5 was thought the whey contribution to the milk price would  
6 not be overstated.

7           This long held assumption is no longer true. As  
8 more processors have invested in whey fractionation  
9 technology, the increased production of whey protein  
10 concentrates has depressed those prices. Simultaneously,  
11 as older plants producing sweet whey have been mothballed,  
12 the supply and demand balance has pushed sweet whey prices  
13 up. Consequently, the milk price factor attributable to  
14 the sweet whey value has outstripped the returns from the  
15 WPC/lactose complex numerous months over the past year.

16           Although, I generally believe markets equilibrate  
17 over time if the returns from one product outstrip the  
18 returns of another, there are several reasons to expect  
19 that the whey markets will not equilibrate as quickly and  
20 gracefully as other markets.

21           Specifically, number 1, whey products fill  
22 different market niches that are driven by different  
23 demand factors. Although, WPC and lactose can be  
24 substituted for sweet whey in some applications, most  
25 applications are looking for the specific attributes of

1 either WPC or lactose. High protein WPCs are typically  
2 competing with other sources of protein, such as soy, that  
3 are disconnected from the overall dairy supply and demand  
4 situation.

5           Number 2, few plants can justify investing the  
6 substantial capital to enable them to shift production  
7 amongst the various whey products on a short-term basis to  
8 exploit more beneficial returns. Many plants cannot even  
9 flip between WPC-35 and WPC-80 production since WPC-35  
10 production requires an evaporator that is not required in  
11 WPC-80 production. And WPC-80 production requires  
12 significantly greater filtration capacity than does  
13 WPC-35. Although new plant investments will be made in  
14 the highest return product, this capacity adjustment  
15 occurs over years rather than over weeks or months.

16           Number 3, substantial volumes of whey products  
17 are exported and are therefore subject to many additional  
18 supply and demand factors unrelated to domestic supply and  
19 demand factors.

20           Because of the diversity of demand for the  
21 various way products, the product prices move  
22 independently of each other. This contrasts sharply with  
23 the cheese side of the complex, in which virtually all  
24 commodity cheese produced in the United States is priced  
25 relatively to a common price series, the CME cheddar

1 price, and therefore cheddar prices serve as an effective  
2 surrogate in the milk price formulas.

3           Diversity of whey production in California and  
4 its consequences. CDFA's summary of dry whey and whey  
5 protein concentrate production during 2004 and 2005  
6 clearly illustrates the challenge of identifying a whey  
7 product representative of statewide production. While  
8 helpful data, it does not reveal the full complexity of  
9 whey production within the state of California.

10           Leprino Foods processes its whey protein stream  
11 into WPC-35, WPC-80 and some specialized whey proteins  
12 within the state of California. As part of this  
13 production, lactose is produced and delactose permeate is  
14 generated. Focusing specifically on the WPC products, we  
15 produce 28 WPC-35 product codes and 33 WPC-80 product  
16 codes. Many of these codes have been developed by our R&D  
17 staff to address specific applications requiring such  
18 attributes as high jelling properties or high heat  
19 stability applications for retort applications. Our  
20 production of generic WPC-35 or WPC-80 is only a portion  
21 of the volume that CDFA would have categorized as WPC-35  
22 and WPC-80 and will likely diminish over time as we expand  
23 in to these more specialized markets.

24           The lack of concrete yield and cost data in the  
25 hearing record upon which to calculate net returns for the

1 various whey products has led to speculation, by some  
2 witnesses, that WPC returns are higher than returns from  
3 sweet whey. The witness for Western United speculated  
4 that, assuming lactose at break even, an average price  
5 difference between sweet whey and WPC-34 of 42 cents from  
6 January 2000 through, I believe it was, December, 2005,  
7 should translate -- through current, whatever her data  
8 was -- should translate in to greater profits from WPC-34  
9 than from sweet whey, unless quote, "...the added costs to  
10 manufacture WPC-34 over skim whey exceeds approximately 42  
11 cents per pound."

12           This conclusion is based upon an assumption that  
13 the same yield can be achieved when producing WPC-34 as  
14 when producing sweet whey. This logic is clearly flawed  
15 on its face. The removal of lactose in order to move the  
16 protein content from 12 percent to 34 percent directly  
17 results in a yield reduction. The fractionation also  
18 results in some of the protein being lost. But ignoring  
19 those losses, only .35 pounds of WPC-34 could be produced  
20 from the raw whey used to produce a pound of whey at 12  
21 percent protein.

22           Again, ignoring the losses that we know are  
23 associated with whey protein fractionation, applying the  
24 yield for the prices over the time period quoted by  
25 Western United shows that WPC-34 produced from the

1 equivalent volume of raw whey would have generated  
2 slightly less, that's 23.08 cents, per equivalent raw whey  
3 volume, than the 23.58 cents per pound sweet whey. From  
4 this price the processor of WPC-34 must also pay the  
5 higher capital and processing costs associated with  
6 fractionating the whey.

7           Applying these optimistic yield assumptions to  
8 the year to date 2006 price data submitted by Western  
9 United further illustrates the challenges facing  
10 manufacturers of WPC-34 this year. The Western skim whey  
11 price series that is used in the 4b calculation has  
12 averaged 33.72 cents, while the WPC price on the  
13 equivalent volume of WPC-34 has averaged only 25.13 cents,  
14 again according to the Western United testimony.

15           Therefore, the WPC-34 manufacturer has paid 8.59  
16 cents per pound whey equivalent or 49.2 cents per  
17 hundredweight more in the Class 4b formula than they  
18 receive for the WPC-34. Again, this is before even  
19 covering the additional costs of fractionation.

20 Additionally, Western United's assumption that lactose is  
21 a break-even proposition is optimistic. While lactose  
22 prices climb intermittently above the processing costs,  
23 they have not remained there over a sustained time period.

24           Lest the Department interpret these arguments  
25 incorrectly, I am not advocating the replacement of the

1 current sweet whey factor with a WPC-34 factor. The point  
2 is that there is not a common whey product produced within  
3 California and the nature of supply and demand in the  
4 various whey markets, both domestically and abroad, make  
5 it nearly impossible to identify a whey product that will  
6 accurately reflect the returns generated by the whey  
7 complex. Therefore, the whey factor should be eliminated  
8 from the formula.

9 Yields. In interests of staying within the  
10 testimony time limitation, the bulk of my discussion on  
11 vat yields can be found in Addendum A. However, I would  
12 like to take a moment to address 2 items.

13 First, the VanSlyke theoretical yield formula  
14 remains the only objective way to determine the cheddar  
15 yield in the absence of actual data related to yields from  
16 unfortified unincented milk. Within that formula, the fat  
17 retention factor should be set at 90 percent. As the  
18 Western United witness noted, Dr. Barbano testified at the  
19 May 2000 federal order hearing that fat retentions in  
20 cheddar operations typically range from 90 to 93 percent,  
21 to be consistent with the minimum milk pricing use of the  
22 yield factor, at the low end of the range 90 percent,  
23 should be used in the formula.

24 Second, the Western United witness implied that  
25 ranch to plant losses were incorporated in the Tong milk

1 composition data and therefore need not be considered in  
2 the calculation of the yield. Although the witness is  
3 correct that Dr. Tong tested milk at the plant using that  
4 data directly in the VanSlyke yield formula does not  
5 automatically capture the ranch to plant losses. The only  
6 way to capture those losses using the Tong data would be  
7 to calculate the theoretical yield based on the Tong data,  
8 but equate that yield to the weight and test data as  
9 measured at the ranch. Dr. Tong's data does not include  
10 ranch level data, therefore the methodology recommended by  
11 Dr. Schiek of Dairy Institute is necessary for the  
12 accurate application of the theoretical vat yield formula  
13 to ranch milk.

14 I'm going to move to my conclusion.

15 The Department's decision from this hearing will  
16 determine whether sufficient plant capacity is developed  
17 to handle the increasing California milk supply. The  
18 alternative route is an increasing level of the dairy  
19 industry equivalent to constipation. In this scenario  
20 milk remains overvalued relative to the net returns that  
21 can be achieved from its manufacture, the lack of  
22 sufficient investment in plant capacity results in  
23 difficulty digesting the milk, and the end result is  
24 neither comfortable nor pretty.

25 The Dairy Institute proposal is founded on the

1 sound principles of valuing milk based upon California  
2 prices, costs and yields. The nuance of eliminating the  
3 whey factor is necessary due to the disconnects in the  
4 whey market. We urge the Department to adopt the dairy  
5 Institute proposal in its entirety.

6           However, we recognize that there is a sense  
7 amongst the producer community that whey is an important  
8 factor in the 4b formula. If the Department is swayed by  
9 such arguments from the producer sector, it is absolutely  
10 critical to the viability of the cheese processing sector  
11 that the whey make allowance be increased to be consistent  
12 with the CDFA whey cost study, and that no snubber be  
13 applied.

14           This concludes my written testimony. I  
15 appreciate the opportunity to provide input to the  
16 Department on these very important issues and respectfully  
17 request the opportunity to file a post-hearing brief.

18           HEARING OFFICER KRUG: Thank you, Ms. Taylor.  
19 Your request to file a post-hearing brief is granted. And  
20 I'll just note also that it appeared that you skimmed over  
21 parts of your written testimony in respect for the time  
22 limits. Please be aware that the full text of your  
23 comments are in the record and will be considered and  
24 given equal weight with all the other oral testimony.

25           MS. TAYLOR: Thank you.

1 HEARING OFFICER KRUG: Does the panel have any  
2 questions for this witness?

3 Mr. Gossard.

4 AGRICULTURE ECONOMIST GOSSARD: Ms. Taylor, on  
5 page 2 of your testimony you stated in general terms how  
6 transportation costs have increased 15 percent in one case  
7 and 20 percent in another. In your post-hearing brief,  
8 could you more fully document these actual hauling costs?

9 MS. TAYLOR: Actually, I cannot. I had that  
10 discussion with my senior management team, and due to  
11 sensitivity with customers, we're not going to disclose,  
12 in writing, the per pound basis on -- in a format that  
13 will be posted on the web. I can tell you in rough terms  
14 it's 1 to 2 cents a pound.

15 AGRICULTURE ECONOMIST GOSSARD: On page 6 you  
16 make the assumption that skim whey powder is 12 percent  
17 protein. I think at least somewhere else in the record  
18 somebody assumed 12.5 percent. Is 12 percent the standard  
19 assumption?

20 MS. TAYLOR: I inquired of our vice president of  
21 whey marketing and sales who's been in the business for  
22 over 30 years, and his rule of thumb is 12 percent across  
23 the industry. He indicated that there is a range of 11 to  
24 14. Mozzarella whey is typically a slightly lower  
25 protein. Cheddar whey is slightly above the 12 percent.

1 Acid whey would be somewhere in the 13 percent  
2 neighborhood. But he was very confident that 12 percent  
3 is the accepted rule of thumb in the industry.

4 AGRICULTURE ECONOMIST GOSSARD: On page 7 you  
5 addressed many -- well partly -- on pages 5, 6 and 7 you  
6 addressed many of your concerns regarding the whey factor  
7 currently in the Class 4b pricing formula. Over the long  
8 run, however, it is presumed that the industry will  
9 respond to changing production and prices of the various  
10 whey components. And one would assume over the long run  
11 that the whey stream will be a profit center of some sort  
12 for the cheese industry.

13 How are we to capture that profitability as part  
14 of the 4b formula?

15 MS. TAYLOR: I'm not sure that I can draw the  
16 conclusion that over the long run whey will be a profit  
17 center. Your contention that the price -- the prices and  
18 returns will equilibrate, as I indicated in my testimony,  
19 is an assumption I generally do hold for most markets.  
20 However, in the whey complex, because of the extraordinary  
21 level of capital investment and the disincentives due to  
22 that capital investment to invest in redundancy within the  
23 same plant, you will not see the convergence, I don't  
24 believe, that you normally would in other market places.  
25 Yes, as new plant capacity comes on, it will help move us

1 toward a convergence, but that may be over a period of  
2 years as opposed to a period of months.

3           Additionally, we'd have all the other market  
4 factors, including the international dynamics, where  
5 lactose may be very much in demand in a particular  
6 marketplace, but WPC not be, so you have, you know, lack  
7 of consistent feedback through the entire system.

8           AGRICULTURE ECONOMIST GOSSARD: To summarize your  
9 answer, is a good economist in the long run dead?

10           (Laughter.)

11           MS. TAYLOR: That could be the case. The pain  
12 that you endure to get there may be too much.

13           AGRICULTURE ECONOMIST GOSSARD: Finally, you  
14 support the Dairy Institute's proposal that in the cheese  
15 formula the yield should be 10.0 based on 367 fat 8.8  
16 solids nonfat as being more representative of farm milk.  
17 Unfortunately, or fortunately, the cost studies that you  
18 so highly praise are based on plant operations where the  
19 yield factor is in the high 10.8, 10.9. Do you have any  
20 costs for a cheddar plant operating with 367 8.8 milk and  
21 a yield of 10?

22           MS. TAYLOR: I do not have those costs, but I  
23 would observe -- I would expect the costs based on the  
24 cost studies, which reflect fortified vat yields to be  
25 lower per pound of cheese than they would be if you didn't

1 have the fortified vat fat yields, because you are gaining  
2 something in yield efficiencies and cost efficiencies,  
3 otherwise you would not be fortifying.

4 AGRICULTURE ECONOMIST GOSSARD: No further  
5 questions.

6 Thank you.

7 HEARING OFFICER KRUG: Are there any additional  
8 questions for this witness?

9 No additional questions, thank you very much, Ms.  
10 Taylor. You're excused.

11 At this time, we've completed with the public  
12 comments portion, unless Mr. Albert Nunes has arrived?

13 MS. LaMENDOLA: He currently is on his way but he  
14 is not here yet.

15 HEARING OFFICER KRUG: Okay. We will fit him in  
16 when he arrives, if he arrives. In that case, we will  
17 recommence with the testimony for Western United Dairymen  
18 followed with the completion of the testimony from the  
19 Milk Producers Council.

20 Will the witnesses please be aware that you are  
21 still under oath from yesterday's testimony. And just for  
22 clarification yesterday, you submitted and we admitted  
23 into evidence text of your testimony. It's labeled  
24 Exhibit number 54. You may proceed.

25 MS. LaMENDOLA: I believe we left off right

1 around our point number 2 in respect to dry whey make  
2 allowance, which is on page 15.

3 A different approach to setting the dry whey make  
4 allowance was taken by almost all participants at the  
5 recent federal order manufacturing cost allowance hearing.  
6 Brian Scott Burleson, director of manufacturing for  
7 ingredients, Division of WestFarm Foods, presented data  
8 detailed regarding the incremental cost to dry whey above  
9 the cost to dry nonfat dry milk.

10 Even though CDFA dry whey manufacturing cost data  
11 was available, most testified in support of this method  
12 for determining the dry whey make allowances. Supporters  
13 included, but not limited to, National Cheese Institute,  
14 Agri-Mark Dairy Cooperative, Land O'Lakes, Northern West  
15 Dairy Association and Leprino Foods. Our table below  
16 summarizes available data that could be used to set the  
17 dry whey make allowances and the various sources from  
18 which the data was gathered.

19 It's interesting to note a few points that  
20 highlight the large discrepancies between the CDFA dry  
21 whey cost study figures and those figures supported by a  
22 number of industry experts nationwide.

23 First, the USDA reported a weighted average cost  
24 11.4 per pound for the 6 plants surveyed nationwide.  
25 Though testimony at the federal order hearing seems to

1 indicate that these costs may be understated due to the  
2 misunderstandings in reporting processes. This figure is  
3 considerably lower than that report by CDFA.

4           Number 2 at the February '05 California hearing  
5 Sue Taylor of Leprino Food stated that Leprino had no dry  
6 whey facilities within the state of California. At the  
7 request of the hearing panel she supplied dry whey  
8 manufacturing costs for their plants in New York and  
9 Michigan. The weighted average costs, adjusted to better  
10 reflect costs in California, were reported at 21.9 cents  
11 per pound. This is substantially lower than the 26.73 per  
12 pound cost reported in the CDFA cost studies and is  
13 derived from mozzarella plants with higher dry whey costs.

14           In a post-hearing brief submitted for the recent  
15 federal order hearing Dr. Yonkers of the National Cheese  
16 Institute supported a 22.2 per pound dry whey make  
17 allowance. This is substantially lower than that  
18 supported by California cheese manufacturers at this  
19 hearing.

20           Number 4, in a post-hearing brief submitted for  
21 the recent federal order hearing, Sue Taylor of Leprino  
22 Foods states quote, "The proposed whey make allowance of  
23 22.15 cents is also consistent with the cost that would be  
24 determined by adding the change in Leprino's sweet whey  
25 processing cost since the survey period that was used to

1 establish the current whey make allowances," end quote.  
2 This is substantially lower than the 26.73 per pound cost  
3 reported in the CDFA cost studies.

4           Number 5, in a post-hearing brief submitted for  
5 the recent federal order hearing on behalf of Agri-Mark,  
6 Inc., Northwest Dairy Association, Foremost Farms U.S.A.  
7 Cooperative, Associated Milk Producers Inc., and Land  
8 O'Lakes, a 21.6 per pound dry whey make allowance was  
9 supported. This is substantially lower than the make  
10 allowance being requested by some today.

11           Proponents of a 26.73 per pound or higher dry  
12 whey make allowance will likely discredit this discussion  
13 because it is not specific to California. Even so, the  
14 figures supported above by cheese manufacturers all over  
15 the nation, including some with plants and interests in  
16 California, seem to support a dry whey make allowance far  
17 below that detailed by the cost studies. Testimony from  
18 cheese manufacturers at the federal order hearing, tells  
19 us that dry whey facilities cross the U.S. are able to  
20 manufacture dry whey at costs closer to 20 to 22 cents per  
21 pound. This begs the question, what is happening to  
22 California?

23           Substantial evidence was provided at the federal  
24 order hearing to support the addition of approximately 2  
25 and a half cents to the nonfat dry milks cost to capture

1 the incremental costs associated with drying whey over  
2 nonfat dry milk. Given the concern over the dry whey  
3 cost studies released by CDFA, we concur that this could  
4 be an appropriate method to take care of California. At  
5 the very most, it supports maintaining the current 20 cent  
6 per pound allowance.

7           Concern was previously raised over comparing dry  
8 whey processing costs to those of nonfat dry milk because  
9 of the differences in plant sizes. The nonfat dry milk  
10 cost studies showed 4 plants with similar volumes at the  
11 dry whey plants. The 4 nonfat dry milk plants in the  
12 medium cost category process a total volume of 238.5  
13 million pounds or an average of 59.6 million pounds at a  
14 weighted average cost of 17.33 cents per pound.

15           The 3 dry whey plants processed an average of  
16 31.1 million pounds, adding an estimated 2 and a half  
17 cents per pound of incremental costs associated with the  
18 dry whey to the 17.3, results in an approximate dry whey  
19 manufacturing cost of 19.83 cents per pound. If something  
20 higher than a 20 cent per pound make allowance is set, say  
21 26.73, then we would expect an explanation as to why dry  
22 whey manufacturing costs in California exceed costs at  
23 comparable nonfat dry milk plants by 9.4 cents per pound,  
24 when plants in the rest of the U.S. experience only a 2.5  
25 cent per pound difference.

1 Additional concerns.

2 First, it's disturbing that even though the CDFA  
3 dry whey cost study was available for use at the federal  
4 order hearing very few relied on it, even though witnesses  
5 testified to the fact that the average volume of the  
6 California plants add approximately 31 million pounds was  
7 consistent with average whey plants nationally. No one  
8 relied solely on the results.

9 This seems peculiar given the CDFA cost data for  
10 butter, nonfat dry milk and cheese plants was used in  
11 conjunction with the RBCS study without reservation.

12 Second, at the February '05 hearings, Sue Taylor  
13 of Leprino Foods discussed the allocation of milk  
14 receiving costs to whey at the same rate per pound solids  
15 are attached to cheese. In her testimony she stated that,  
16 "From the business and policy perspectives, we do not  
17 believe milk costs, whether actual costs or milk receiving  
18 costs, should be allocated to whey." We concur.

19 Discussions with the cost unit verify this allocation  
20 does, in fact, occur. Whey, as a byproduct of cheese,  
21 should not carry milk and receiving costs as these costs  
22 are accurately reflected in the cheese manufacturing  
23 costs.

24 Finally, only 79 percent of the skim whey powder  
25 processed in California is represented in the cost

1 studies. This volume is far less than the volume  
2 represented in the manufacturing cost data for butter at  
3 99.9 percent, Cheddar and Monterey cheese 98.5, and nonfat  
4 dry milk at 99.17.

5           Due to the multitude of reasons explored above,  
6 we support the approach taken at the recent federal order  
7 hearing of adding 2 and a half cents to the powder  
8 processing costs. This supports maintaining the current  
9 20 cent per pound make allowance for dry whey. We urge  
10 the Department to make no changes to the current make  
11 allowance. There are simply too many unanswered questions  
12 regarding the dry whey cost studies, and the current  
13 allowance can be supported by recent expert testimony.

14           MR. MARSH: The 2004 manufacturing cost data  
15 released by CDFA does not support any changes to the  
16 manufacturing cost allowances at this time. We thank the  
17 Department for withdrawing the labor and energy updates to  
18 the cost studies and we do encourage, once again, the  
19 Department to follow the advice of their independent CPAs  
20 and discontinue publishing false financial information,  
21 such as that anymore.

22           According to past hearing panel reports, the  
23 Department has adhered to a historical policy establishing  
24 manufacturing cost allowances that are consistent with  
25 volume coverage among butter, nonfat dry milk and cheddar

1 cheese. According to the 2004 cost studies the current  
2 allowances covered 75 percent of the butter, 63 percent of  
3 the nonfat dry milk and 62 percent of the cheddar cheese.

4 Further review of the data sheds some additional  
5 insight. For butter, the 75 percent processed at a cost  
6 less than the make allowance was manufactured at a  
7 weighted average cost of 12.3 cents per pound or 3.3 cents  
8 below the current make allowance. For nonfat dry milk,  
9 the 63 percent processed at a cost less than the make  
10 allowance was manufactured at a weighted average cost of  
11 13.73 cents per pound or 1 and a half cents below the  
12 current make allowance. For cheese, nearly 77 percent was  
13 manufactured at a weighted average cost of 17.1 cents per  
14 pound, exactly at the level of the current make allowance.

15 The coverage is consistent, perhaps even  
16 exceeding in some areas, with the targeted coverage  
17 detailed in the panel report from the last hearing: 65  
18 percent of butter, 67 percent of nonfat dry milk and 79  
19 percent of cheddar cheese. Clearly, no increases are  
20 justified at this time.

21 We understand the need for adequate plant  
22 capacity within the state. However, we know that  
23 adjustments to the current make allowances, at least of  
24 the magnitude requested, will not encourage additional  
25 plant capacity. As explained above, impediments to

1 additional plant capacity in the state go far beyond the  
2 make allowance.

3           Therefore, we realize the goal of setting the  
4 correct make allowances is tied more directly to the  
5 health of the current plant capacity. Given the  
6 manufacturing cost data released by the Department and the  
7 corresponding volume coverage, we feel this goal has been  
8 met with the allowances currently in place. No changes  
9 should be made to the current manufacturing cost  
10 allowances and department data clearly supports this  
11 notion.

12           With regard to the alternative proposals, we'll  
13 comment briefly on items not yet addressed in our  
14 testimony above.

15           California Dairy Campaign. We cannot support the  
16 implementation of the variable make allowance proposed by  
17 CDC. According to Department analysis for the period 2001  
18 to 2005, the variable make allowance proposed would result  
19 in a reduction in Class 4a prices in 3 of the 5 years with  
20 an average reduction of 11 cents per hundredweight.  
21 Likewise, the proposed variable allowance would result in  
22 a reduction of the Class 4b price in 4 of the 5 years,  
23 with an average reduction of 15 cents per hundredweight.  
24 We cannot support a decrease in producer prices of this  
25 magnitude. Clearly this is similar to the last time that

1 this was brought forward, which resulted in a decrease in  
2 producer prices of about \$175 million over a period of 5  
3 years.

4           These reductions are mostly offset, however, by  
5 the increases in the Class 4a and 4b prices due to CDC's  
6 proposed elimination of FOB adjusters, which we cannot  
7 support. The elimination of FOB adjusters could have  
8 potentially devastating implications for California  
9 processors. And we do need processing capacity in the  
10 state. The potential of eastern markets that could result  
11 from a loss the adjusters would undoubtedly result in a  
12 direct negative impact to producers, either through  
13 reductions in premiums or dividends paid. The loss of  
14 markets for California manufactured products could  
15 eventually also have long-term impacts on the ability to  
16 maintain plant capacity in the state.

17           California Dairies Inc. We are supportive of the  
18 CCC purchase price floor, but not of any changes to  
19 manufacturing cost allowances as noted above.

20           Alliance of Western Milk Producers. We're  
21 supportive of the CCC purchase price floor, but not of any  
22 changes to manufacturing cost allowances.

23           Milk Producers Council. We support the  
24 implementation of a snubber on the dry whey price at 20  
25 cents per pound as proposed by MPC. As argued above, the

1 formula should capture the value of the milk used to  
2 manufacture cheddar cheese. If there's no value to dry  
3 whey in any given month due to a low selling price, then  
4 its contribution should be 0 not negative. We are also  
5 concerned with the implementation of the correct  
6 manufacturing cost allowance.

7           The implementation of any incorrect make  
8 allowance should not drive the whey contribution into  
9 negative territory. Doing so, at the expense of  
10 producers, would ignore the revenues obtained by cheese  
11 plants through the manufactured of higher valued WPC  
12 products. While we have not asked that producers get to  
13 enjoy the returns of the higher value whey products, we do  
14 ask that if the price of the lowest valued whey product,  
15 skim whey, does fall below the manufacturing cost  
16 allowance, the producers are not penalized for settling  
17 for the lower valued whey product.

18           Our board found MPC's idea of incorporating WPC  
19 34 percent into the dry whey component intriguing, but  
20 felt that the specific details of its inclusion had yet to  
21 be fleshed out. Additionally, the idea of a credit to  
22 processors for the sale of cheese to the CCC has some  
23 merit. However, due to the streamlines recently  
24 implemented by the CCC, we don't feel a credit is needed  
25 at this time.

1           Land O'Lakes. We do not support the change to  
2 the dry whey manufacturing cost propose by LOL, as we are  
3 supportive of the current 20 cent per pound allowance in  
4 place. Our extensive arguments are detailed above.

5           A couple of other things off the written items.  
6 On the capacity issue, which we've heard many of the  
7 processing folks paternalistically discuss with regard to  
8 taking care of the dairy producers in the state, we  
9 believe that that is clearly a different issue. I think  
10 as former president of the board of Western United  
11 Dairymen Ray Souza discussed, that's likely an issue that  
12 should be discussed by the industry and then brought to  
13 the Secretary versus having this type of forum at a  
14 hearing make that determination as to whether or not we  
15 have adequate plant capacity or whether or not that should  
16 be incented through the make allowance.

17           Of course, again as indicated, that should be an  
18 industry impetus and it should occur in a different venue,  
19 particularly when we're looking at a potential situation  
20 coming out of an outcome of this hearing where you're  
21 looking to tax dairy producers in the state of California  
22 at the rate of about \$200 million a year and transferring  
23 that money to the processors in the state of California.  
24 That's too big of an issue and a policy issue to be  
25 determined at this hearing.

1           Milk production, as we've heard from producers  
2 who have testified, is likely not sustainable in the state  
3 given the current negative margins that producers are  
4 experiencing within the state of California. We have seen  
5 a decline in milk production. But at the same time I  
6 believe that once again, as Mr. Souza noted in his  
7 testimony, how can farmers continue to operate at \$1.92  
8 below their cost of production with the regard to their  
9 pay price?

10           Again, we renew our objections to the call of  
11 this hearing. We also renew our objection to the lack of  
12 adequate notice on the return on investment adjustment  
13 that was made in the manufacturing cost studies. And we  
14 also renew our objection to the inclusion of specious  
15 financial data in the hearing record over the objection of  
16 CDFA's own independent CPAs.

17           This concludes our testimony. Western United  
18 Dairymen thanks CDFA staff for their efforts in preparing  
19 for this hearing. We would be pleased to answer any  
20 questions that you might have. And we also request, as  
21 noted before, the option to file a post-hearing brief.

22           HEARING OFFICER KRUG: Thank you, Mr. Marsh and  
23 Ms. LaMendola for your testimony. Your request to file a  
24 post-hearing brief is granted. And as with the previous  
25 witness, I'll note that there were portions of your

1 written testimony that you seem to skim over in respect  
2 for the time, the full text of your testimony is entered  
3 into the record. And it as well as any of your  
4 supplementary comments will be fully considered by the  
5 Department.

6 Do the panel members have any questions for the  
7 witnesses?

8 Mr. Gossard.

9 AGRICULTURE ECONOMIST GOSSARD: An earlier  
10 witness, Mr. Van Vlecht, stated that having a hearing on  
11 the first of the month or the last day of the month  
12 created problems for some dairy farmers who might wish to  
13 attend this hearing, in general, because of doing  
14 payrolls. Is that something that Western United's aware  
15 of among its producer members?

16 MR. MARSH: We did receive some notice of concern  
17 over that and it did cause some problems for producers  
18 getting here. Actually, I think from some of the  
19 producers that I did have an opportunity to visit with,  
20 they were also very concerned because they got so far  
21 behind this year with regard to planting of crops and  
22 harvesting of hay, because of the wet weather we had.

23 AGRICULTURE ECONOMIST GOSSARD: But in general in  
24 the long run, it might be better to hold a hearing on the  
25 second rather than the first?

1 MR. MARSH: That may be a good idea.

2 AGRICULTURE ECONOMIST GOSSARD: Twice, page 4 and  
3 then later in your testimony, you mentioned the  
4 streamlining of the CCC purchase plans. Could you  
5 document those changes in your post-hearing brief.

6 MR. MARSH: We'd be happy to.

7 AGRICULTURE ECONOMIST GOSSARD: On page 5 of your  
8 testimony, in making your recommendation for the FOB price  
9 adjusters, you used a weighted average rather than a  
10 simple average. At the last hearing, the Department had  
11 expressed some concern that weighting the data twice might  
12 lead to some bias in the estimator. Do you have any  
13 comments on the concern the panel raised at the last  
14 hearing on that issue?

15 MS. LaMENDOLA: Well, we would agree with prior  
16 testimony, in that we were trying to capture what the  
17 majority of cheese or butter sold for. So we thought in a  
18 weighted average you would capture, for instance, you  
19 know, one pound was sold at a lower price, one pound at a  
20 higher price, you could accurately capture what the  
21 majority of the product was sold for by using a weighted  
22 average.

23 AGRICULTURE ECONOMIST GOSSARD: On page 16 of  
24 your testimony you have an extensive table on whey  
25 processing costs or dry -- skim whey powder processing

1 costs. Do you have any data connected with these costs as  
2 to the relative size of an operation that would generate  
3 these costs?

4 MS. LaMENDOLA: We are simply citing testimony  
5 that was presented at prior hearings. And that testimony  
6 came from plants with experiencing in drying whey. So in  
7 reviewing their testimony, I don't recall actual plant  
8 sizes. I do recall reference to, you know, sort of the  
9 average capacities at dry whey facilities in California's  
10 plants being, you know, consistent with that average, but  
11 I didn't see specific reference to any volumes, at least  
12 in the review that I did.

13 AGRICULTURE ECONOMIST GOSSARD: On page 17 next  
14 to the last paragraph, it starts concern was previously  
15 raised over comparing dry whey costs to nonfat dry milk  
16 because of plant size differences, and then you cite some  
17 data from CDFA. Was that data based on the cost studies  
18 that were entered into the exhibit or was that based on  
19 another departmental document?

20 MS. LaMENDOLA: Yeah, that's the 2004 unadjusted  
21 cost studies. And the number we cited was for the medium  
22 range nonfat dry milk costs, weighted average for that  
23 range.

24 AGRICULTURE ECONOMIST GOSSARD: Given that the  
25 size of the skim way powder plants are half that of the

1 nonfat dry milk plants, wouldn't it be more likely that  
2 the costs would fall somewhere between the medium nonfat  
3 dry milk plants with an average size of 60 million pounds  
4 and the 3 high cost plants with an average size of 13  
5 million pounds?

6 MS. LaMENDOLA: Well, the costs for the 13  
7 million pounds seem to me to be kind of an outlier. We  
8 don't really know what size the specific plants are within  
9 any category. And to prior testimony, I guess we would  
10 ask you in that you know each plant's actual capacity. In  
11 getting as close as we could, that seemed like a  
12 reasonable comparison on size.

13 Now, I don't know some of those within that range  
14 might be quite smaller, some might be larger. We really  
15 just aren't privy to that information.

16 AGRICULTURE ECONOMIST GOSSARD: Finally, on  
17 page --

18 MS. LaMENDOLA: Can I add one more thing, in  
19 that, in using that low cost, we've heard a lot of  
20 testimony as far as efficiencies and economies of scale.  
21 So to go all the way down to an average size of 13 million  
22 pounds might seem to skew it in the other way quite a bit.  
23 So there again we just would rely on you to look at the  
24 actual plant sizes.

25 AGRICULTURE ECONOMIST GOSSARD: Finally, on page

1 18 again, the second to the last paragraph that begins,  
2 "According to past hearing panel reports...", you estimate  
3 the volume covered with the current manufacturing cost  
4 allowances. What document did you use to come up with  
5 those estimates?

6 MS. LaMENDOLA: Those are the -- it's actually  
7 what's cited on the individual cost study pages for the  
8 2004 cost studies. You guys put that up at the top or, I  
9 guess, down at the bottom, how much volume was covered  
10 under each product. And that was simply pulled from the  
11 cost study pages.

12 AGRICULTURE ECONOMIST GOSSARD: Okay. Thank you  
13 very much. I just wanted clarification on the data  
14 source.

15 No further questions.

16 HEARING OFFICER KRUG: Are there any additional  
17 questions for the witnesses?

18 Ms. LaMendola, in your last statement you  
19 referenced a prior cost study, is that cost study in the  
20 record?

21 MR. MARSH: I'm sorry?

22 HEARING OFFICER KRUG: It is.

23 The cost study that you referenced in your  
24 testimony in your responses to Tom. All I'm saying is --

25 MS. LaMENDOLA: Yes.

1 HEARING OFFICER KRUG: -- if it's not in the  
2 record, you should ensure that it is.

3 MS. LaMENDOLA: No, it should be. I imagine it's  
4 the current cost study, yeah.

5 HEARING OFFICER KRUG: Thank you very much.

6 Thank you very much for your testimony.

7 You're excused.

8 We will now proceed with the testimony from Milk  
9 Producers Council who will continue with their testimony  
10 from yesterday.

11 Okay, just for the record, yesterday the Milk  
12 Producers Council submitted written testimony that was  
13 marked Exhibit 61 and admitted at that time. If you'll  
14 please again identify yourselves, and then you may proceed  
15 with your testimony. Again, keeping in mind you're still  
16 under oath from yesterday's hearing.

17 MR. VANDEN HEUVEL: Geoffrey Vanden Heuvel.

18 MR. VAN DAM: And William C. Van Dam.

19 HEARING OFFICER KRUG: Proceed.

20 MR. VAN DAM: Both from Milk Producers Council.  
21 Yesterday when I was giving the testimony, I got as far as  
22 the bottom of page 7, if you'd care to follow along in  
23 your copies there. Earlier in my testimony I made  
24 reference to us using a correlation coefficient rather  
25 than the multiple regression, and Exhibit E attached to

1 our testimony is a write-up of what the 2 are for your  
2 reference and to show where we got our information.

3 Cheese issues. Milk Producers Council has  
4 repeatedly ask for and defended the snubbing of prices at  
5 the federal support price for butter, nonfat dry milk and  
6 cheese. Of these 3, cheese is the only product for which  
7 there are production and packaging requirements for the  
8 sales to CCC that are substantially different than the  
9 norm for commercial sales. It is important to note that  
10 only in cheese have prices ever dropped substantially  
11 below support price. In November of 2000, cheese prices  
12 over a 4-week period averaged 11.6 cents per pound less  
13 than the support price. The lowest price during that  
14 period was 98 cents per pound on November 4th of 2000 or  
15 15 cents below the support price for cheese. This is the  
16 extreme example, but it happened and it can happen again.

17 There is no good, reasonable or rational answer  
18 to that market of 2000, but it happened. Data prepared by  
19 NMPF indicates that the extra costs of preparing cheese  
20 for sale to this CCC are equal to 5.6 cents per pound of  
21 cheese. Why then did the price not stop dropping once it  
22 was low enough to cover the added costs?

23 We'll never know for sure, but equally for sure  
24 it makes no sense for dairy producers to just sit and wait  
25 for it to happen again. The cost in terms of producer

1 income was staggering, and it happens while there is a  
2 safety net in place, put in place by Congress, called a  
3 support price. This makes no sense to us and we feel the  
4 greatest shortfall of the current system, both in  
5 California and in the whole nation, is that this can  
6 happen. And, of course, if something can happen,  
7 eventually it will happen.

8           When I wrote this material -- I'm going off the  
9 text now. When I wrote this material, the cheese prices  
10 had been steadily climbing for several weeks and I was  
11 feeling like, okay it's probably not going to happen. And  
12 then we come here to Sacramento, I stop watching the  
13 market, and it starts dropping on us again, as it has been  
14 the last couple of days, once again, renewing the worry  
15 that this -- we're headed in that direction towards  
16 support and it could just blow right through it going down.  
17 I'm not saying it will. I can't predict. I'm just saying  
18 it can happen and some day it will happen.

19           This is easy to fix by adding a snubber to  
20 prevent the average price of cheese, as now measured by  
21 CME prices, to drop below support. We propose just such a  
22 snubber. And in return for getting that snubber, we offer  
23 to offset the costs of actual sales to CCC by instituting  
24 a CCC transaction allowance to cover the added cost and  
25 offer the added incentive to cheese plants of a market

1 margin allowance.

2           CCC Transaction Allowance. MPC recognizes the  
3 added cost of selling cheese to CCC and is proposing that  
4 producers agree to pay 5 cents of the 5.6 cents of those  
5 added costs for those cheese plants making sales to CCC.  
6 We are calling this a CCC transaction allowance and the  
7 objective is to compensate the cheese plant 5 cents per  
8 pound of cheese sold to CCC under the support price  
9 program.

10           However, since payments by CCC are made FOB to  
11 production plant here in California, it is not appropriate  
12 to allow the California price adjuster -- to allow the  
13 deduction of the California price adjuster and we suggest  
14 that this amount be deducted from the 5 cent transaction  
15 cost. If the current 2.9 cent adjuster remained in place,  
16 the CCC transaction allowance would be 2.1 cents per  
17 pound. And I've got the math there 5 cents minus the 2.9  
18 adjuster leaving 2.4. Another example would be that if  
19 the California price adjuster was set at 2.4 cents per  
20 pound, indicated by the audited price survey, the CCC  
21 transaction allowance would be set at 2.6 cents per pound.  
22 Again, the math is there, 5 cents less the 2.4 equals 2.6.

23           Market Margin Allowance. Early versions of the  
24 4b pricing contained a sliding scale on the make allowance  
25 that was in effect -- that, in effect, allowed cheese

1 manufacturers a better deal when prices were high and a  
2 close-to-actual-cost-deal when prices were low. This was  
3 in place for quite some time, but was finally eliminated  
4 when after a period of high cheese prices the margins  
5 allowed were no longer sensible.

6           Our proposal avoids the pitfalls of indexing,  
7 while giving a significant boost to cheese plant profits  
8 in times of higher prices. The proposal is to add another  
9 allowance in the cheese formula that reduces the 4b milk  
10 cost by 2.5 percent of the difference between the support  
11 purchase price for cheese and the actual CME price.

12           As the 4b formula now works hundred percent of  
13 any increase or decrease for that matter in the market  
14 price gets passed on to the producer via the 4b price.  
15 With the market margin allowance that changes to 2.5  
16 percent gets added to the cheese plant margins via a lower  
17 milk price and the remaining 97.5 percent is passed on to  
18 the producer.

19           The CCC transaction allowance and the market  
20 margin allowance are proposed in conjunction with a  
21 snubber being added to the 4b formula that prevents the  
22 cheese price used in the 4b formula from dropping below  
23 the federal support purchase price. We are offering a  
24 deal. Of course, we would take the snubber without giving  
25 either allowance, and snubbers have been in place before,

1 but pressures build to remove the snubbers and eventually  
2 they did get removed. On the other hand, we are not  
3 suggesting that either the CCC transaction allowance or  
4 the market margin allowance would be acceptable without a  
5 snubber being added. Our goal is to remove the objections  
6 to the snubber and have it stay in the formula without  
7 continuous attack.

8           The use of a snubber on cheese will not put  
9 plants in California at a competitive disadvantage because  
10 the marketplace needs the cheese produced here. It also  
11 needs the cheese from all other parts of the country and  
12 all of those plants already have access to the market and  
13 sell their cheese into that market. The only change will  
14 be that everyone in the cheese market will know that  
15 support is truly the floor price, just as it is in butter  
16 and nonfat dry milk markets.

17           The California Price Adjuster. Milk Producers  
18 Council has long thought that the California price  
19 adjuster was out of step with reality -- with the reality  
20 that California is now, and has been for quite some time,  
21 the residual source much cheese in this country. As such,  
22 prices for cheese should increasingly act as if they were  
23 priced here in California instead of in Chicago or  
24 Greenbay. The result of that should be that the  
25 difference between the price -- in price between the CME

1 and the actual sales price in California should gradually  
2 narrow.

3           Our proposal to apply only 50 percent of the  
4 difference was designed to force that result. However,  
5 much of our thunder and indignation was removed when the  
6 new audited data was released showing that the difference  
7 was 2.34 cents instead of 3.24 cents per pound first  
8 reported. The new numbers indicated a gradual decrease in  
9 the difference as opposed to the first reported number  
10 which was an increase in the difference. Instead of  
11 pressing this particular issue now, we are content to wait  
12 and watch and appreciate the workings of the market.

13           Cheese yield. While we believe that the cheese  
14 yield used in the 4b formula is, if anything, low, it is  
15 our position that overall the formula does yield a  
16 rational price. The issue of cheese yield has been  
17 thoroughly debated in previous hearings and the Department  
18 has wisely left the yield alone. All of this early  
19 testimony has been referenced into this hearing record.  
20 In light of this history and the consistency of the  
21 Department findings in the past, it is time to judge any  
22 changes against a higher standard that demands compelling  
23 new evidence to support the change.

24           We would like to add one new piece of evidence  
25 that supports no change in the yield factor. We call the

1 panel's attention to an article on page W-86 and W-87 of  
2 the April 25, 2006 edition of Hoard's Dairymen. The  
3 article is about Hilmar Cheese's ground breaking at their  
4 new plant in Dalhart, Texas. The article includes a table  
5 of cheese yields that was used by Patty Stroup, the  
6 spokesperson for Hilmar Cheese during her presentation on  
7 how Hilmar Cheese Company's cheese yield based pricing  
8 program works. According to that table on their, at 3.7  
9 percent butterfat and 3.1 percent protein, the yield is  
10 listed at 10.2 pounds per hundredweight. Need we say  
11 more. A copy of that table is attached. It's exhibit B.

12           Whey butterfat. The average butterfat content of  
13 milk in cheddar cheese plants is nearly 4 percent. Even  
14 if all the Jersey milk produced is allocated to cheese  
15 plants, as most of it is, there is not enough of it to  
16 move the average up to 4 percent. Since we know of no  
17 cheddar plants actually purchasing fresh cream and we do  
18 know that cheddar plants do purchase condensed skim, it  
19 seems clear that they are wisely tailoring their milk  
20 components to maximize the use of whey cream in cheese.

21           Seldom, if ever, do cheese plants make or sell  
22 whey cream butter. Plant managers have learned over the  
23 years that rotating the whey cream after processing back  
24 into later vats of cheese is a far more preferable  
25 recovery than making off-grade butter. Because of this,

1 it no longer makes sense to apply the 10 cent per pound  
2 deduction for whey cream presently found in the 4b  
3 formula.

4           We propose that the whey cream be valued at the  
5 butterfat values established in 300(D)(1). Because this  
6 section already contains a make allowance and the FOB  
7 California price adjuster and is adjusted for butter  
8 yield, the butterfat value should be used without  
9 additional adjustments times the yield of whey cream.

10           Formula manufacturing cost allowances. MPC has  
11 no objection to changes in existing manufacturing cost  
12 allowances as long as they are done on the basis of actual  
13 cost increases. The indexing proposal of Alliance of  
14 Western Milk Producers is a major change from existing  
15 procedure in that for the first time cost allowances would  
16 be adjusted based on factors other than real costs. As  
17 such, it removes the incentive for plants to aggressively  
18 manage their input costs, because the indexing formula  
19 would always protect them.

20           Additionally, experience has shown that in the  
21 volatile market conditions -- that in volatile market  
22 conditions indexing will often lead to unacceptable  
23 results. For these reasons, we cannot support this  
24 indexing proposal.

25           We have already requested an opportunity to file

1 a brief.

2 MR. VANDEN HEUVEL: Yeah. We do have a few other  
3 comments to make based on things that had been said  
4 earlier in the hearing. One was a question that Mr.  
5 Gossard asked of a witness in regards to buttermilk  
6 powder. And we did want to note that there is no proposal  
7 in front of this hearing with regards to changing the way  
8 we calculate the 4a price with regards to solids nonfat,  
9 but that question did come up, and so we wanted to address  
10 that.

11 It's important to note that we have known for a  
12 long time that 4a solids nonfat is a combination of sale  
13 of nonfat dry milk and buttermilk powder. And the  
14 Department did yield studies, probably a decade ago  
15 already, that calculated the amount of nonfat dry milk and  
16 buttermilk powder that was yielded from milk that went to  
17 California powder plants. And those yield -- that yield  
18 study showed that -- and I am going from memory -- but it  
19 was about 103 to 104 pounds combined of powder was  
20 produced from 100 pounds of SNF, which is logical, because  
21 there's moisture in the finished product of somewhere  
22 between 3 and 4 percent. And yet the yield -- so that  
23 means for every 100 pounds of SNF that they're paying to  
24 farmers, they're getting to 103 to 104 pounds of finished  
25 product that they're able to sell.

1           The yield we use is 1. And we don't argue with  
2 that 1, because we realize that buttermilk powder is kind  
3 of the wild card in that, and sometimes it returns as much  
4 as nonfat, sometimes a little less and it will vary. And  
5 you also didn't hear the witness who brought that issue up  
6 asking for any change, but I would -- we wanted to bring  
7 that point into the hearing with regards to buttermilk  
8 powder and the yield.

9           The other issue, and I don't know, maybe Mr.  
10 Gossard is going to ask us about this with regards to whey  
11 cream and our proposal to value the whey cream portion at  
12 the butterfat value, because it's very clear from and very  
13 consistent over really many, many years that -- and there  
14 is way more vat -- fat butterfat in the vat in California  
15 than can be accounted for by the amount of milk that comes  
16 into that plant. I mean, three six five to three seven,  
17 you know, it changes a little from year to year, but  
18 that's where farm milk is.

19           I did check with the DHIA and the Jersey  
20 population while increasing is still, I think, less than  
21 10 percent of the cows in California. And so there's just  
22 mathematically not enough fat to get to the those vat fat  
23 levels, absent some supplemental fat. And we don't know  
24 of any cheese plants that are buying fat to put in a vat.  
25 So we have to conclude that -- I mean that is why we

1 conclude that the whey cream in cheddar -- and this is the  
2 main point for Mr. Gossard. We are dealing with a cheddar  
3 pricing formula.

4           And while I understand in other cheese products,  
5 because of the nature of those products, this may not make  
6 sense, we are -- we have decided as a matter of policy and  
7 practice to price milk for cheese at the 4b formula based  
8 on a cheddar formula. And those cheddar vats have got  
9 additional fat in them. And that fat has got to come from  
10 somewhere and that whey cream is where it's very likely  
11 coming from.

12           With regards to then not having a whey cream  
13 yield, well, there has to be a whey cream yield, because  
14 we're not valuing the full 11 pounds that they're making  
15 out of that vat in our 4b formula. We have a yield that's  
16 based on 91/92 percent fat recovery. And you can kind of  
17 back your way into it using the VanSlyke, and we're not  
18 going there.

19           But the fact remains that the yield that we use  
20 in the 4b formula is based on a, somewhere between, 90 and  
21 93 percent fat recovery, and that they're not throwing  
22 that additional 7 to 10 percent fat away. It has to be  
23 accounted for in the 4b formula. We're valuing it as whey  
24 cream, and it seems like the evidence is really pointing  
25 that that whey fat is coming back into the cheese vat.

1 And so those are -- that's really the answer to Mr.  
2 Gossard's question.

3           You have to have full accounting of all 100  
4 percent of the butterfat that goes into a cheese plant.  
5 We decided to value some of it as cheese and the other  
6 portion as a whey fat value. We're just making the point  
7 here that they're not making "b", so there's no reason for  
8 the 10 cent deduction to correct for double A to B and  
9 they're already getting a make allowance in the butterfat  
10 price that we're suggesting the 4a butterfat price has  
11 already taken out of it a make allowance to convert  
12 regular fat to butterfat -- to butter. So those are  
13 answers to those couple of questions that came up.

14           And then just probably one last comment. There's  
15 a lot of talk about, you know, plant capacity. And this  
16 is a difficult issue for the industry to wrestle with and  
17 for the Department to wrestle with. I appreciate the  
18 difficult job that you've had. And, you know, I can think  
19 back to the first time I testified I think it was 19 -- I  
20 don't know -- '85 or '86. And in the old Department  
21 auditorium, the panel sat way up here. We sat down here.  
22 We kind of looked up and this was a pretty intimidating  
23 thing. We were battling about those same issues then.

24           It's a different industry today. It's a much  
25 more mature industry today than it was then. And I really

1 hope that the Department -- I find it fascinating that  
2 it's the processors who are worried about plant capacity.  
3 I would think most buyers would be thrilled to have their  
4 suppliers just dying to give them everything they could  
5 get, which I think should tip you off that, you know,  
6 maybe there's something else going on here.

7           When you look at the base economics of the  
8 proposal of the Dairy Institute, it's to transfer  
9 somewhere between 100 million and 200 million out of  
10 producer's pockets into theirs, with no corresponding  
11 commitment to build anything. And I think there's a lot  
12 wisdom. I really admire my colleagues like Domenic  
13 Carinalli and Ray Souza who have been in this industry for  
14 decades and not typically testify, but they came up here  
15 and they shared with you.

16           What Dairy Institute is proposing is a radical  
17 policy change. It is not supported by producers. When  
18 this policy was implemented in a more modest form in the  
19 early eighties, it was supported by the vast majority of  
20 producers. It is not today. We need to look at other  
21 alternatives. We've got to talk about plant capacity.  
22 But I think the Department took upon itself in the  
23 eighties to provide a California home for every gallon of  
24 milk any California dairymen wanted to produce. And you  
25 could do that with when you had a pretty strong industry

1 consensus, which you don't have today.

2           But what you're essentially being asked to do  
3 today is to socialize the cost of expanding plant capacity  
4 to take money from Domenic Carinalli up there in the north  
5 bay who has no opportunity to grow to take advantage of  
6 that new plant capacity, or the gentleman from Marin  
7 county, and any number of the other producers in this  
8 state. We have to -- we're being asked to support a  
9 policy that works for on -- maybe one region, you know,  
10 the central valley. Although, I would argue, and have  
11 argued, that it really doesn't work long term there  
12 either.

13           We have to come to grips with the fact that this  
14 industry is probably about as big as it can get in terms  
15 of big capacity. We can still grow small -- with small  
16 increments, but we can't see the kind of 5 to 10 percent  
17 gains. We just don't have the ability to do that. It's  
18 not sustainable. And, you know, the amount of money we're  
19 losing right now, you know, the numbers will speak and you  
20 will see by later this year reactions from the producers  
21 in terms of production and supply and demand will come in  
22 to balance.

23           And so I think, you know, the Department has a  
24 difficult job. They've got to weigh a lot of conflicting  
25 testimony. I imagine you guys will spend a lot of time

1 trying to sift through this and do the write thing. I've  
2 got huge respect for you, and I think you will do the  
3 right thing and we'll survive, and do okay. But I think  
4 the Dairy Institute is proposing a radical solution that  
5 doesn't work for the next century.

6 HEARING OFFICER KRUG: Thank you very much. Your  
7 request for a post-hearing brief was granted yesterday.  
8 Yes, it's clear. It's been granted.

9 Are there any questions for the witnesses?

10 HEARING OFFICER KRUG: Mr. Gossard.

11 AGRICULTURE ECONOMIST GOSSARD: On page 4 of your  
12 testimony, when you were estimating the protein value in  
13 the skim whey powder, what assumptions did you make about  
14 the protein level?

15 MR. VAN DAM: I was thinking about that this  
16 morning. I'm pretty sure I used 12 and a half. I could  
17 get back to you with the exact number.

18 AGRICULTURE ECONOMIST GOSSARD: If you'd put that  
19 in your post-hearing brief.

20 MR. VAN DAM: Yes, I will. And then 34 percent  
21 for the whey protein concentrate.

22 AGRICULTURE ECONOMIST GOSSARD: My next question  
23 is on page 8. You have a proposal for the cheese formula  
24 for a snubber and then a transaction allowance for sales  
25 to the CCC. That's only going to work for cheddar cheese.

1 What about mozzarella plants? They would still be having  
2 a problem. They don't have the support purchase price for  
3 mozzarella.

4 MR. VAN DAM: Mozzarella cheese is almost totally  
5 made to market. They already have to deal with the market  
6 conditions. And if the price that the world has for  
7 cheddar cheese is above support and their entire pricing,  
8 system, as they've admitted and it is so, is based on the  
9 price of cheddar cheese off the CME exchange, there will  
10 be no harm. They still have to make their adjustments for  
11 volume based on what their customers want, not based on  
12 anything that's in the pricing system.

13 MR. VANDEN HEUVEL: Let me add to that. You know  
14 the whole idea behind this is to keep the price from  
15 dropping below support by making the support price a  
16 meaningful price. And I think what was demonstrated in  
17 2002 was that because both the federal and the State --  
18 both the federal order system and the State 4b price  
19 allowed processors to essentially -- I mean, they were  
20 inoculated. I mean it's amazing they stopped at 98 cents,  
21 really. Theoretically, they could have gone all the way  
22 down to 50 cents or whatever. And I guess if they got,  
23 you know -- if they gave the cheese away, we'd have to  
24 write them checks for the make allowances.

25 I mean, theoretically we could come on with a

1 negative 4b price the way this thing is currently  
2 constructed. And the idea was -- but what we found was --  
3 an interesting history was that when Secretary Lyons put  
4 in that snubber, you know, days before it became  
5 implemented, boy, that market price started moving up,  
6 which was a pretty clear signal that what California  
7 decides to sell its cheese for -- what our processors'  
8 cheese plants decide their cheese for has a huge role in  
9 what the national price surface is for cheddar cheese and  
10 therefore all cheese.

11 AGRICULTURE ECONOMIST GOSSARD: Thank you. No  
12 further questions.

13 HEARING OFFICER KRUG: Do any other panel members  
14 have questions for the witnesses?

15 Mr. Ikari.

16 DAIRY MARKETING BRANCH CHIEF IKARI: I just have  
17 one. Maybe I missed it, but I didn't see testimony with  
18 respect to the floors on had 4a. Has MPC taken a position  
19 on that?

20 MR. VAN DAM: We would be for the floor, but we  
21 have not taken a position at this hearing on that.

22 DAIRY MARKETING BRANCH CHIEF IKARI: Okay.  
23 Because I didn't see that in your testimony.

24 MR. VAN DAM: No, we did not mention it. Our  
25 concern is the floor on 4b, that's where we think the big

1   payoff is and the big concern is.

2               DAIRY MARKETING BRANCH CHIEF IKARI:   Okay.   And  
3   the federal government has never implemented a floor is my  
4   understanding, am I correct, in their Class III or Class  
5   IV price?

6               MR. VAN DAM:   I'm afraid I can't answer that.   I  
7   don't remember.   I don't remember that they've done it, so  
8   I can't argue that they did.

9               MR. VANDEN HEUVEL:   Their history -- you know,  
10   for many years they operated with EMW, which was a, you  
11   know, a different type of a pricing series, so then they  
12   adopted a product value system like we have really in the  
13   last decade.   And they make changes really, really slow.  
14   There is no floor, and I don't think there ever has been  
15   in the last decade in that system.

16              DAIRY MARKETING BRANCH CHIEF IKARI:   Well, we can  
17   agree that since end product pricing has been used in the  
18   federal orders, they have not implemented a floor.

19              MR. VAN DAM:   I think that's correct.

20              MR. VANDEN HEUVEL:   That's correct.

21              DAIRY MARKETING BRANCH CHIEF IKARI:   What do you  
22   think the long term ramifications would be if California  
23   had a floor and the federal orders don't have the floor  
24   and the price could drop below the floor?

25              MR. VANDEN HEUVEL:   I think the California

1 sellers will make sure that the CME price doesn't drop  
2 below floor to protect their markets and they have the  
3 capacity to do that as we saw demonstrated in 2002. No  
4 one else really wants to sell below that price. It  
5 creates lots of political problems if nothing else. But  
6 economically by having the California cheese makers have a  
7 financial incentive to keep it at that -- at the CCC  
8 price, we're setting that market. And remember that we  
9 are not -- we are offering a CCC transaction allowance and  
10 we are also offering a market margin allowance in exchange  
11 for that snubber.

12           DAIRY MARKETING BRANCH CHIEF IKARI: On page 2  
13 you talked about no longer having Federal Order 135. And  
14 does a deregulation of major market undercut or enhance  
15 the regulated price in a state program?

16           MR. VANDEN HEUVEL: In which state program?

17           DAIRY MARKETING BRANCH CHIEF IKARI: In the  
18 California program.

19           MR. VANDEN HEUVEL: Bill, as you know, has quite  
20 a bit of knowledge and so I'll say a few things, but  
21 certainly Bill might be able to add to this. I think  
22 Order 135 going out is a disturbing trend. I understand  
23 why it happened. Through the affiliation that we have  
24 with producer trade associations with the dairymen that  
25 are in Idaho and Utah, we have gotten to know the

1 producers there, they have voted out 135 because they're  
2 very, very frustrated with the slowness of USDA's hearing  
3 process. And, you know, I think some of those guys are  
4 regretting it today. Some others in Idaho are not  
5 regretting it. They have a different attitude.

6 I think it's a danger signal for us in terms of,  
7 you know, how you maintain regulated prices when you have  
8 neighboring areas that are unregulated. And I do think,  
9 you know, over the next 5 to 10 years we could go a  
10 variety of directions. And I think this -- so, you know,  
11 I can't answer your question as to, you know, whether it's  
12 good or bad for us, but it's certainly something that we  
13 ought to be concerned about. But I don't think you can be  
14 just a little bit regulated, you're either regulated or  
15 you're not regulated. And trying to be regulation light  
16 doesn't work in this context. By having a low regulated  
17 price in California, they'll just match it. I mean, it  
18 won't work for us.

19 DAIRY MARKETING BRANCH CHIEF IKARI: But isn't  
20 there also a risk if you have a large amount of milk  
21 that's unregulated that the higher you raise the regulated  
22 price can you really sustain that in terms of you have an  
23 artificially high price, but can you really market your  
24 product?

25 MR. VANDEN HEUVEL: No, you can't, but we're not

1 asking you for an artificially high price. We're not  
2 asking -- you know, it was very interesting to us -- you  
3 know, we tried to -- we're in favor of the current 4b  
4 formula, okay. We opposed and strongly urged the  
5 Secretary not to hold this hearing. The 4b -- we're not  
6 asking for a price increase. We came up with some ideas  
7 and some alternatives which then your staff, you know, ran  
8 the numbers on and we were surprised as anyone to see that  
9 our proposals, when the Department did the analysis,  
10 resulted in a price increase. That was not our intent.

11           So, you know, the premise of your question -- if  
12 the premise of your question is can you support an  
13 artificially high price? No, but we don't think we're  
14 asking for an artificially high price. We think the  
15 current 4b price is about right. And, you know, the only  
16 thing that's made it a little bit skewed is the fact that  
17 we've had a situation the last number of months where dry  
18 whey appears -- the price appears to be high relative to  
19 the whey protein concentrate price. And so it's created  
20 some tension, but it will correct and it's been correcting  
21 already. I mean, the dry whey price is coming down in the  
22 market place and these markets will correct.

23           So I don't accept the premise -- yet, you cannot  
24 maintain a high regulated price on Class 4 or on Class 1.  
25 I mean, you've got the same, you know, types of issues and

1 so you've got to be sensitive to that.

2 DAIRY MARKETING BRANCH CHIEF IKARI: Thank you.

3 HEARING OFFICER KRUG: Are there any additional  
4 requests for the witnesses?

5 RESEARCH MANAGER II GATES: Just one question.

6 HEARING OFFICER KRUG: Ms. Gates.

7 RESEARCH MANAGER II GATES: Mr. Vanden Heuvel,  
8 just one quick question. On page 7 at the bottom of the  
9 second paragraph. "That being said, if the only other  
10 option is removal of the whey factor from the 4b formula,  
11 we would support adding WPC-34 with a manufacturing cost  
12 allowance that is calculated to make whey price neutral  
13 over the past 5 years." What did you mean?

14 MR. VANDEN HEUVEL: If you take the existing --  
15 you know, we had a difficult time. I was very intrigued  
16 with Tom's question of -- who did he ask? He asked  
17 someone to put on the record a manufacturing cost, I think  
18 it was Patty from Hilmar on WPC. You know, we scoured the  
19 record for a cost for WPC. And, you know, the record is  
20 pretty empty, so we're hoping Patty comes through with  
21 some numbers there to help educate us.

22 But lacking that, we just take the whey  
23 values -- the dry whey value generated over the last 5  
24 years, take the whey protein concentrate market prices and  
25 back our way in to a make allowance for WPC-34, so that

1 the end result is the same price as what we would have had  
2 in the dry whey formula.

3 RESEARCH MANAGER II GATES: Okay. Thank you.

4 HEARING OFFICER KRUG: Any additional questions  
5 for the witnesses?

6 No additional questions. Thank you very much.  
7 You're excused.

8 We have one more witness signed up. Mr. Richard,  
9 Cotta would you please come forward. And after Mr. Cotta  
10 testifies, has Albert Nunes arrived yet?

11 MS. LaMENDOLA: He should be here within minutes.  
12 We're have someone watching for him.

13 HEARING OFFICER KRUG: Okay. These then are our  
14 last witnesses present. If anyone else wishes to testify,  
15 respond or add to, your opportunity will be following  
16 these witnesses.

17 Mr. Cotta, I see that you're not alone there.  
18 Could you both please identify yourself?

19 MR. COTTA: Richard Cotta, California Dairies.

20 MR. HEFFINGTON: Joe Heffington with California  
21 Dairies. Last name is spelling H-e-f-f-i-n-g-t-o-n.

22 HEARING OFFICER KRUG: Okay. Mr. Heffington, do  
23 you swear or affirm to tell the truth?

24 MR. HEFFINGTON: I do.

25 HEARING OFFICER KRUG: I don't recall whether I

1 swore you in yesterday or not. You were both sworn and  
2 you remain sworn at this time.

3 And you are representing California Dairies  
4 Incorporated?

5 MR. COTTA: Yes.

6 HEARING OFFICER KRUG: You're continuing to  
7 represent California Dairies Incorporated?

8 MR. COTTA: Yes.

9 HEARING OFFICER KRUG: Okay. You may proceed  
10 with your testimony.

11 MR. COTTA: And we've been sworn at since  
12 yesterday too.

13 (Laughter.)

14 MR. COTTA: I merely wanted to clear up one of  
15 the answers to Mr. Ikari's question yesterday on plant  
16 capacity.

17 If you took it to mean what was the entire -- the  
18 plant capacities available in all the states, I took your  
19 question to indicate what is the balancing capacity left  
20 in the state of California. And from our perspective, the  
21 balancing has capacity been used up, as evidenced by  
22 what's occurred this winter, as evidenced by what's  
23 occurred during the peak time of production. And I wanted  
24 to come back up and just clarify that point, not speaking  
25 as to what maybe available for cheese manufacturing plants

1 or whatever, but our balancing capacity is stretched and  
2 is full. So I wanted to clarify that.

3 HEARING OFFICER KRUG: Do you have anything else  
4 to add?

5 No.

6 HEARING OFFICER KRUG: Any questions for the  
7 witnesses?

8 Not seeing any questions, thank you very much,  
9 Mr. Cotta and Heffington.

10 Now, would anyone else like to testify? I see  
11 Mr. Schiek has indicated a request. Would you please come  
12 forward.

13 DR. SCHIEK: Thank you.

14 HEARING OFFICER KRUG: Would you please identify  
15 yourself again for the record.

16 DR. SCHIEK: Yes. I'm William Schiek,  
17 S-c-h-i-e-k.

18 HEARING OFFICER KRUG: Yes. And as with the  
19 others, you were sworn in yesterday and you remain sworn.  
20 Please proceed.

21 DR. SCHIEK: Yeah. I wanted to get on the record  
22 with some testimony responding to some of the new  
23 information that was submitted, so that I can address it  
24 in a post-hearing brief.

25 HEARING OFFICER KRUG: And you are speaking on

1   behalf of --

2               DR. SCHIEK:   Of the Dairy Institute.

3               HEARING OFFICER KRUG:   Thank you.

4               DR. SCHIEK:   The Center for Race, Poverty and the  
5   Environment has submitted a letter to the Secretary that  
6   has been entered into the hearing record suggesting that  
7   this proceeding and the potential amendments to the  
8   stabilization and marketing plans are subject to CEQA  
9   requirements.  I would like to make some comments here and  
10  reserve the right to elaborate further in my post-hearing  
11  brief, which was granted yesterday.

12              This proceeding and any amendments to the plans  
13  do not mandate any entity to undertake activities that  
14  would impact environmental quality.  Any activity in this  
15  industry that might have the potential impact on  
16  environmental quality, such as building or expanding  
17  processing plants or constructing or expanding new  
18  dairies, are reviewed by a variety of State, regional and  
19  local agencies.

20              It is my understanding that procedures and  
21  proceedings by which product manufacturers or milk  
22  producers gain approval from these oversight agencies for  
23  new and ongoing activities are subject to extensive  
24  review, that includes determinations as to whether the  
25  activities requires CEQA review.  Since CEQA requirements

1 are reviewed by these oversight agencies, it is, in my  
2 view, and backed by extensive history of CDFA hearings,  
3 such as this one, that amendments to the milk  
4 stabilization and marketing plans are not subject CEQA. I  
5 just wanted to put that on the record and elaborate on it  
6 in my brief.

7 I wanted to make a comment on the issue of R  
8 squares versus correlation coefficients in terms of  
9 appropriateness. This is just one of those picayunish  
10 sorts of things that economists get really concerned  
11 about. It's my contention that R square is more  
12 appropriate in a correlation coefficient. And that's a  
13 technical, statistical argument that I'll put in my brief  
14 and not bore everybody here with it, but I wanted to  
15 address that.

16 And finally, comments from Western United  
17 Dairymen in their testimony regarding their offer to host  
18 a public dialogue on a bunch of the issues confronting the  
19 industry. I just have to say we really welcome that offer  
20 and we are always eager to participate in industry  
21 discussions about how to handle to meet new challenges  
22 facing the industry.

23 However, I'm kind of concerned, possibly with the  
24 potential inference from their testimony from statements  
25 by Mr. Ray Souza early this morning that might be that the

1 hearing panel need not address the plant capacity issue  
2 because the producers and the processors are going to get  
3 together and figure this out and come up with an agreement  
4 on how to solve the problem.

5           Now, I don't want to be a pessimist, but my  
6 experience in the industry today here in California and  
7 even in the industries back east earlier is that issues --  
8 on issues such as these, the industry can get together and  
9 have discussions and there is a considerable exchange of  
10 opinions and views, respect for other people's view  
11 points, even education that occurs between the different  
12 parties involved, but little agreement on how to proceed.  
13 The Secretary and Department staff will probably remember  
14 the Costa Round Table in 1997, where producer and  
15 processor groups could not really even agree on what had  
16 happened in the past, let alone what was going to be the  
17 best course to pursue in the future.

18           This is just but one example. Others more recent  
19 include the workshop held by the Department last fall that  
20 was part of the may hearing decision, and the CMAB Study  
21 Steering Committee meetings this year where there's  
22 likewise been little consensus. Another example would be  
23 the transportation allowance series of workshops that the  
24 Department invested a lot of time. Again, a lot of  
25 discussion, very profitable, people learn a lot from it,

1 but there doesn't seem to be anything that really comes  
2 out of it. I'm not trying to jinx it before it happens,  
3 but I think we've got to be realistic.

4           The Legislature, I would also point out, has  
5 given the Secretary both the authority and the  
6 responsibility to operate the milk stabilization marketing  
7 plans and program, such that the public interest is  
8 served. And I think it's, therefore, appropriate and  
9 necessary for the Department to engage and make needed  
10 changes to the stabilization plans based on hearings such  
11 as this one. And we urge the Department not to abdicate  
12 its responsibility by leaving it to an industry discussion  
13 that has never, in my experience, reached consensus on  
14 pricing or policy issues.

15           It's also been said repeatedly at this hearing  
16 that the time could not be worse for the hearing. And we  
17 understand producer costs are up compared to where they've  
18 been in the past years and that milk prices are down, and  
19 we understand that. I think we talked at length in our  
20 testimony about the margin crisis that's facing the  
21 manufacturers, particularly cheese makers. Again, from my  
22 experience, I would say that looking at producer  
23 statements in the past, it's really never a good time to  
24 make pricing adjustments downward. And, you know, in 2005  
25 I'd say the producer community argued just as vehemently

1 against any corrections or any increase in cheese maker  
2 margins as they have today.

3 And prices were high in 2001 and in 1999, and  
4 likewise there were arguments against any increases in  
5 plant margins. So I just want to say that delaying an  
6 adjustment that is needed in the formula will only make  
7 matters worse for producers in the long run as milk supply  
8 continues to outstrip capacity.

9 Thank you. That's all I have.

10 HEARING OFFICER KRUG: Are there any additional  
11 questions for this witness?

12 Not seeing any additional questions, you're  
13 excused.

14 Yes, is there an additional --

15 MR. VAN DAM: Just a question of the hearing  
16 officer about admissibility of material in post-hearing  
17 briefs. There were a couple of things that I have not  
18 mention in my testimony, I'll respond to from other  
19 people. Do I need to have gone up there and responded to  
20 those things in order to put them in the post-hearing  
21 brief, because I'm clear what your instruction was  
22 earlier.

23 HEARING OFFICER KRUG: Okay, and thank you for  
24 mentioning that. I was going to address that right now.  
25 Post-hearing briefs are limited to amplifying, explaining

1 or withdrawing your testimony that was provided. So if  
2 you didn't raise the issue in your testimony, you are  
3 precluded from addressing it in your post-hearing briefs.

4           Having said that, why don't we take about a  
5 5-minute break and you can gather your thoughts as to  
6 whether or not there is something you want to supplement  
7 in your testimony with to allow for your post-hearing  
8 brief, to reply to additional things. And, you know, as  
9 we've noted there have been letters that have been  
10 submitted probably after you prepared your testimony, if  
11 you want to respond to those letters, you might consider  
12 that now and we'll go off the record and take 5 minutes.

13           (Thereupon a recess was taken.)

14           HEARING OFFICER KRUG: Okay. We're back on the  
15 record ready to proceed with our next witness. Mr. Albert  
16 Nunes. Mr. Nunes, would you please state your full name  
17 and spell your last name for the record.

18           MR. NUNES: My name is Albert Lewis Nunes. My  
19 last name is spelled N-u-n-e-s.

20           HEARING OFFICER KRUG: Mr. Nunes, do you swear or  
21 affirm to tell the truth?

22           MR. NUNES: Yes.

23           HEARING OFFICER KRUG: Are you representing any  
24 organization today?

25           MR. NUNES: No.

1           HEARING OFFICER KRUG: Thank you very much. Do  
2 you have any written statements or other documents or  
3 things you'd like entered in to the record.

4           MR. NUNES: Yes, I do.

5           HEARING OFFICER KRUG: Okay, do you have copies  
6 of them or --

7           MR. NUNES: No. Can I get them to you later, fax  
8 or E-mail or something like that or do I have to have it  
9 when I'm here? The problem is is I didn't realize I was  
10 going to do this and I don't have information in a format  
11 I can give to you.

12          HEARING OFFICER KRUG: Okay. Certainly. Why  
13 don't you just submit them with the post-hearing brief.

14          MR. NUNES: Okay. Actually, that's what I meant  
15 to say a post-hearing brief.

16          HEARING OFFICER KRUG: That would be fine.  
17 Proceed.

18          MR. NUNES: A little bit of who I am. I'm an  
19 accountant. I'm a CPA and partner in the firm of Genske,  
20 Mulder and Company. We do -- about 20 percent of the milk  
21 produced in California are our clients. So when I'm  
22 giving you our data set, it's coming from a pretty large  
23 sample size of dairies. We also have dairy clients in  
24 about 27 or 28 other states.

25          What I did was when I heard this hearing was

1 going to come about, I went back and I looked at our cost  
2 studies. And what our cost studies are are basically P&L  
3 statements. And we just summarize them all together and  
4 cost are broken down per hundredweight. And I compared  
5 2004 and 2005 together. And the first thing that I  
6 noticed when I did that was costs to dairymen went up 61  
7 cents a hundred. The other thing I've got to clarify a  
8 little is when I'm looking at that data set, the average  
9 dairy, in the data set that I'm looking at, is 1,935 cows.

10           If I take an average dairy of say 500 to 600  
11 cows, my experience tells me their costs are 20 to 40  
12 cents higher than a dairy this size, because they simply  
13 don't have the economy of scale to have costs cheaper like  
14 usually insurances is 5 or 6 cents higher, fuel and oil,  
15 a little bit on feed supplies. They're just not big  
16 enough to get deals on what they buy.

17           Then I took it and I did, what I call, a  
18 cash-flow break even, what does it take -- what costs does  
19 it take for a dairy to break even? And so I took the  
20 costs in '05 and I looked at putting a 1040 milk price,  
21 which is from what best I can understand myself and hear  
22 from other people 1040 is probably a pretty close to the  
23 milk price you're going to get in '06. That average dairy  
24 is going to lose 2.48 cents a hundredweight or \$507 a cow.

25           Two other things that are not in this. One is

1 interest rates in '05 average prime rate was 6.1 or 6.2  
2 percent. Prime today is 8 and probably going to go a  
3 little higher. Everyone 1 point increase in interest rate  
4 is going to add 13 cents a hundredweight to the dairyman's  
5 cost, so you've got at least 26 cents more coming in to  
6 '06.

7           The other thing that's going on is feed costs.  
8 When I look at my 2005 numbers, that's January through  
9 December, most clients, at least that I have that I look  
10 at, contract their feed, so they contracted feed in '04  
11 at a much cheaper price, and is fed January through  
12 usually June July. And then they don't to have start  
13 buying the higher price feed, because feed went up in '05,  
14 but they didn't actually physically have to pay for that  
15 until probably July on.

16           So I've got a blend of a little cheaper at the  
17 beginning of the year, a little higher at the end. My  
18 guess, it's about 10 cents to 15 cents higher in '06 then  
19 what I'm looking at here from 2005.

20           And just to put cents to dollars, 50 cents is  
21 equivalent to \$102-a-cow loss. So if I increase my costs  
22 by 50 cents, my \$507 loss per cow will turn to \$609 a cow.  
23 The other thing is so these are just strictly hard  
24 numbers, just looking at what would happen. I read the --  
25 well, I don't remember what the wording of it was, but

1 basically the hearing what it was about and I was looking  
2 at I think it was Western United Dairymen calculated a 50  
3 cent increase or 50 cent possible decrease in the price of  
4 milk to dairymen. Well, that's -- again, that's \$102 loss  
5 that you're going to add to the dairymen which is going to  
6 take them from 507 to 607, and then that doesn't include  
7 the increased costs that I know are going to already hit  
8 them in '06.

9           Most banks are going to loan a guy no more than  
10 \$900 a cow. If a guy is going to lose \$500 to \$600 a cow,  
11 where is he going to fund this at? You're going to -- you  
12 know, he's going to -- he's toast. Unless he has no debt  
13 or very little, they're going to have a hard time making  
14 it through this year.

15           My experience is most dairymen are carrying  
16 probably about \$500-a-cow debt. That's their cow debt  
17 normally. And so they have the ability to borrow 400.  
18 People who have been in it a long time, have strong  
19 balance sheets, obviously are going to have no debt or  
20 very little per cow. The average guy is probably \$500 a  
21 cow debt he's going to carry right now.

22           The other thing what I was looking at is, I --  
23 you know we have clients in a lot of other states, and I'm  
24 noticing more and more people wanting to leave our state.  
25 You know, California was, by far, the number one dairy

1 state in terms of milk produced, but also in terms of  
2 profitability. It was a good place to operate. We have  
3 good weather, cheap feed, a lot of good reasons to stay  
4 here.

5 But now with escalating land prices dairymen are  
6 having to get bigger and bigger. Some people get bigger  
7 just because they're greedy. They want more money and all  
8 that. But other people are getting bigger just because  
9 they have to to be able to compete, to be able to stay in  
10 business. They've got to be able to spread their fixed  
11 costs over a lot more cows and they're getting bigger.

12 To get bigger now you're going to have to buy  
13 land. Well, land in California is at least 2 to 4 times  
14 cheaper almost anywhere else you want to go. I mean, you  
15 can go to the midwest, you can go to Kansas, \$1,200 to  
16 \$1,500 an acre, Texas close to the same, Colorado. And  
17 all those places have much cheaper feed costs than we have  
18 here. So we're seeing -- I'm seeing myself more and more  
19 people want to leave our state because it's very hard to  
20 dairy in this state. It's very hard to expand because of  
21 the land prices. It's also very hard to expand because we  
22 have very strict environmental standards that are hard to  
23 meet. They're hard to meet and also very expensive.  
24 They're not even having to pay these costs but, you know,  
25 down the road these costs are going to hit. They're going

1 to have to do, be it lagoon, be it air, whatever you have  
2 to do, that's going to cost money, which is reflected  
3 nowhere in my numbers, because that cost that's eventually  
4 going to hit the dairies aren't even in my numbers yet,  
5 because they're not doing it yet.

6           Those 2 reasons people are leaving -- are  
7 starting to leave our start. We're already seeing  
8 Washington more profitable than California and Texas.  
9 We're seeing other states getting closer and closer to  
10 California.

11           The other thing that I'm seeing in California  
12 that the dairymen need to do, which I just went over, they  
13 actually have to more profitable than the other states  
14 just to be able to afford to buy the land to expand that,  
15 to be able to afford the environmental costs that we know  
16 are coming down the road. So my point was, is when I look  
17 at these numbers, I actually never looked at them until I  
18 was going to come and speak at the hearing and go over the  
19 numbers. I was shocked at the loss that would happen if  
20 milk stayed at 1040. And I already know in my practice  
21 starting already in probably April, May, I noticed  
22 dairymen were saying hey, we're having a hard time paying  
23 bills. You know, what's going on? Is there anything we  
24 can do?

25           My first gut reaction was like, I mean, milk has

1 only been down a couple of months, why would you guys be  
2 crying so early? But when I go back and look at the  
3 numbers, I can see why. When I went back to '05, and most  
4 people assume that '05 was a pretty good year, because  
5 milk only dropped 70 cents a hundredweight over '04. But  
6 because of the increase costs, the average dairy, this  
7 1,935 dairy only made 29 cents a cow per hundred.

8           So when we came into '06 and milk dropped, milk  
9 only had to drop 29 cents and they're already breaking  
10 even. Well, when it came down to 1050, I can see very  
11 quickly why they're crying, because it -- the costs went a  
12 lot higher than I expected myself, and I know that  
13 dairymen expected and everybody else.

14           That's all I have.

15           Anybody have any questions?

16           HEARING OFFICER KRUG: Thank you very much, Mr.  
17 Nunes. And as referenced in our prior dialogue, you are  
18 granted the opportunity to submit a post-hearing brief,  
19 during which time you can submit the documents you  
20 referenced.

21           Do any of the panel members have questions for  
22 this witness?

23           Mr. Gossard.

24           AGRICULTURE ECONOMIST GOSSARD: Yes. These costs  
25 you were giving, those were just for your California

1 clients, correct?

2 MR. NUNES: Correct.

3 AGRICULTURE ECONOMIST GOSSARD: So the 1,900-cow  
4 dairy was California average?

5 MR. NUNES: Correct.

6 AGRICULTURE ECONOMIST GOSSARD: When you submit  
7 your post-hearing brief, as a good CPA, you will carefully  
8 layout all those figures you were talking about, so we can  
9 see them in tabular form?

10 MR. NUNES: I'll tell you what I'll do I'll show  
11 it to you and you tell me what format you want it in and  
12 I'll do it.

13 AGRICULTURE ECONOMIST GOSSARD: Okay. Finally,  
14 you mentioned the increase in land costs in California, is  
15 this -- do you do anything besides dairies?

16 MR. NUNES: Yes.

17 AGRICULTURE ECONOMIST GOSSARD: You do other  
18 agriculture.

19 MR. NUNES: Correct.

20 AGRICULTURE ECONOMIST GOSSARD: Is this  
21 increasing land cost a problem in other agricultural areas  
22 of California?

23 MR. NUNES: Yes, but the only thing that affects  
24 the dairy is the dairy too expand has to have land because  
25 you need, you know, so many cows per acre. A farmer

1 doesn't have to expand. He can keep where he wants to go.  
2 He can rent ground. A dairyman has to buy ground to be  
3 able to expand. And so they're going to have a little bit  
4 harder -- it affects them more than I would say a regular  
5 farmer.

6 AGRICULTURE ECONOMIST GOSSARD: And what's the  
7 reason for the increase in land costs in California?

8 MR. NUNES: Too many people, jobs.

9 AGRICULTURE ECONOMIST GOSSARD: Urbanization.  
10 Thank you.

11 No further questions.

12 HEARING OFFICER KRUG: Any additional questions?

13 Mr. Ikari.

14 DAIRY MARKETING BRANCH CHIEF IKARI: Yes. When  
15 you file your post-hearing brief, it would be helpful for  
16 me, how many dairy -- maybe you said this, how many dairy  
17 farmers are included your cost and kind of the spread  
18 between of -- how long have you been doing this?

19 MR. NUNES: Myself?

20 DAIRY MARKETING BRANCH CHIEF IKARI: Yes.

21 MR. NUNES: Ten years. And I'll give you my back  
22 ground. I was born and raised on a dairy, and I have a  
23 dairy. So my background was basically my whole life was  
24 dairy related. The amount of -- we have 20 percent of the  
25 milk produced in California are our clients. In terms of

1 dairies, it's not going to be 20 percent of the dairies,  
2 because we tend to have a little larger over the smaller  
3 dairies.

4           DAIRY MARKETING BRANCH CHIEF IKARI: Well, you  
5 gave averages, but I'm curious about ranges.

6           MR. NUNES: Can you clarify what you mean by  
7 range to me? You mean, like 600-cow dairies?

8           DAIRY MARKETING BRANCH CHIEF IKARI: Well, in  
9 terms of -- in terms of costs, what are some of the  
10 low-costs producers doing, because, you know, we have an  
11 interesting phenomenon for 20 years we've increased  
12 production. And I assume that those producers at the  
13 bottom end or the most efficient producers are the ones  
14 expanding. And you indicated that, you know, that dairies  
15 are getting larger.

16           MR. NUNES: I'll tell the most -- the unique  
17 thing when I looked at the numbers were this, we have a  
18 thing called our top 25 percent. It's the 25 percent most  
19 profitable clients. We use that as a benchmark to compare  
20 the people to say if you're not making money, what are you  
21 doing wrong to be able to do that.

22           The top 25 percent obviously makes money than the  
23 average. But the average herd size in the top 25 percent  
24 is 3,500 cows. There's not -- you know, there's not that  
25 many 3,500-cow dairies other than the Tulare area, a

1 couple in the Modesto and Stanislaus are. But these  
2 larger guys are basically Tulare.

3           When I took the top 25 and I looked at '04 and I  
4 found what they did with the money in '05, the top 25 paid  
5 debt down in '05. The average client debt increased. He  
6 expanded. He made money in '04 and he expanded because he  
7 wants to get bigger and more efficient and actually had a  
8 little bit more debt in '05 than he did in '04, because he  
9 had a good year in '04. That's what he used his money to  
10 do.

11           DAIRY MARKETING BRANCH CHIEF IKARI: The persons  
12 that are going to survive are the ones with a low debt  
13 load, I imagine.

14           MR. NUNES: No, the most efficient. When we look  
15 at our top 25 percent, and I compare them to the average  
16 guy, the odd thing is sometimes interest costs are  
17 actually higher on the top 25 than it is on the average.  
18 It's still -- you know, in a diary all you can do is  
19 control your costs and be efficient. And if you incur  
20 debt the right way and leverage it the right way, whatever  
21 you use your debt to buy is going to make enough money to  
22 make your payment. And also it's the structure of your  
23 debt, if you can make it long term on land, the smaller  
24 the payment, there's a bunch of different ways.

25           DAIRY MARKETING BRANCH CHIEF IKARI: The

1 information that you have is with respect to California?

2 MR. NUNES: Yes, but I can give you any other  
3 state you wanted. I mean we have Texas, New Mexico,  
4 Arizona, Idaho, Washington, high plains, which is Kansas,  
5 and Oklahoma and Nebraska, I believe.

6 DAIRY MARKETING BRANCH CHIEF IKARI: Because the  
7 interesting thing is with low prices what area of  
8 production goes out first in the nation. And if you can  
9 correct the production problem, you can raise the prices  
10 and so those people who survive, you know, how long is  
11 this going to last, but we won't see it until production  
12 comes in to balance with the demand. And the question is  
13 does more of the California farmers goes out before more  
14 of the mid-western farmers go out?

15 MR. NUNES: Who will go out first is the last to  
16 have built and started a dairy. Say, somebody started  
17 within the last 3 years, which there's a decent amount in  
18 the midwest dairy or high plains area, they're going to  
19 hurt a little bit more because they have -- they're much  
20 higher leveraged than they are here. They're going to  
21 have a lot -- probably double the leverage we have here.

22 DAIRY MARKETING BRANCH CHIEF IKARI: So based on  
23 the cost of production information that's available to  
24 Genske Mulder, can you -- will that information kind of  
25 give you an estimate of what areas you think might be

1 hurting?

2 MR. NUNES: What areas are going to be hurting?

3 Wow, I'm not sure I understand your question right, but if

4 I just look at California, and if my numbers are real, and

5 they are real, these come from, you know our clients,

6 you're going to have a huge blood letting in California if

7 milk stays at 1040. You knock 50 cents off of that and --

8 you can only borrow 900 bucks a cow.

9 DAIRY MARKETING BRANCH CHIEF IKARI: Yeah. Well,

10 that's a comparative advantage. And I guess I'm asking

11 the question if you have information on costs throughout

12 the U.S., what areas are the most vulnerable to low prices

13 and which should you see the impact on their production

14 levels, first?

15 MR. NUNES: You know, I couldn't give you that

16 answer. I don't know. That's a good question. I

17 couldn't give you that answer.

18 DAIRY MARKETING BRANCH CHIEF IKARI: Okay.

19 HEARING OFFICER KRUG: Any additional questions

20 for this witness?

21 Thank you very much Mr. Nunes.

22 MR. NUNES: You're welcome.

23 HEARING OFFICER KRUG: That completes the list of

24 persons that have signed up. I know Mr. Van Dam would

25 like to speak again. If anyone else has anything or would

1 like to testify or supplement their testimony, please come  
2 forward.

3 Mr. Van Dam.

4 Just state your name for the record and proceed.

5 MR. VAN DAM: My name is William C. Van Dam. And  
6 the only reason I'm up here is to touch on 3 topics that I  
7 intend to discuss in the post-hearing briefs. And since I  
8 don't believe I touched on them during my testimony, I  
9 want to make sure that the record stays complete.

10 The first is with regard to Hilmar's Appendix B.  
11 I believe there's flaws in the presentation on that table  
12 having to do with gross manufacturing margins for cheese  
13 plants. And I intend to submit a corrected, at least in  
14 my eyes, version of that table.

15 Number 2 is a list of plants that went out of  
16 business. There's a point to be made there about dairymen  
17 going out of business that has been -- not -- we have not  
18 touched on or talked about the counterpoint to that, and I  
19 will discuss that in my post-hearing brief.

20 And the last one is the issue that was touched on  
21 by lots of people, that was the issue that the pricing of  
22 milk in California is only part of the reason for plants  
23 deciding not to build their new -- or companies deciding  
24 not to build their new plants here. And I want to spend  
25 some time discussing that and pointing out that the other

1 issues are undoubtedly of greater consequence than the  
2 price alone.

3 That's it. Thank you very much.

4 HEARING OFFICER KRUG: Thank you very much, Mr.  
5 Van Dam.

6 Does anyone -- you're excused.

7 AGRICULTURE ECONOMIST GOSSARD: Wait.

8 HEARING OFFICER KRUG: Oh, Tom.

9 (Laughter.)

10 AGRICULTURE ECONOMIST GOSSARD: Mr. Van Dam, you  
11 stated that you, in one of part of your post-hearing  
12 brief, you were going to discuss dairies going out of  
13 business; is that correct?

14 MR. VAN DAM: It was plants with a list in there,  
15 and part of what I was to going to comment on is dairies  
16 have gone out of business too and I'm not sure it's a  
17 relevant point.

18 AGRICULTURE ECONOMIST GOSSARD: Okay. But have  
19 the cows gone out of business?

20 MR. VAN DAM: Some of them. I'm a CWT guy, so I  
21 know about some of that stuff, too.

22 AGRICULTURE ECONOMIST GOSSARD: Okay. But if you  
23 would address both dairy numbers and cow numbers, it would  
24 be helpful.

25 MR. VAN DAM: I will.

1 HEARING OFFICER KRUG: Anything else for the  
2 witness?

3 Okay, now you're excused.

4 MR. VAN DAM: Thank you.

5 Does anyone else have anything that they would  
6 like to testify to?

7 Not seeing anyone else, all persons present and  
8 desiring to testify having done so and no additional  
9 evidence to be presented, this hearing is now closed at  
10 12:14 on June 2nd.

11 We're off the record.

12 Back on the record.

13 Post-hearing briefs will be due to the Dairy  
14 Marketing Branch by 4 p.m. on Monday, June 12th. The  
15 briefs can be E-mailed to the Dairy Branch that's  
16 dairy@cdfa.ca.gov or faxed to (916)341-6697 or mailed to  
17 the Dairy Marketing Branch at 1220 N Street, Sacramento,  
18 California, 95814; or if you wish to hand deliver in  
19 person, please deliver the briefs to 560, that's 5-6-0 J  
20 Street, Suite 150, Sacramento, California.

21 Is there anything else?

22 Thank you very much.

23 We're off the record.

## 1 CERTIFICATE OF REPORTER

2 I, JAMES F. PETERS, a Certified Shorthand  
3 Reporter of the State of California, and Registered  
4 Professional Reporter, do hereby certify:

5 That I am a disinterested person herein; that the  
6 foregoing Department of Food and Agriculture, Dairy  
7 Marketing Branch hearing was reported in shorthand by me,  
8 James F. Peters, a Certified Shorthand Reporter of the  
9 State of California, and thereafter transcribed into  
10 typewriting.

11 I further certify that I am not of counsel or  
12 attorney for any of the parties to said hearing nor in any  
13 way interested in the outcome of said hearing.

14 IN WITNESS WHEREOF, I have hereunto set my hand  
15 this 7th day of June, 2006.
